Life Raft.

Patessted Sept. 7, 1858.

Nº 21,462.

UNITED STATES PATENT OFFICE.

JABEZ M. WOODWARD, OF NEW YORK, N. Y.

LIFE-BOAT CONSTRUCTED OF MATTRESSES.

Specification of Letters Patent No. 21,462, dated September 7, 1858.

To all whom it may concern:

Fig. VIII, is a side elevation showing the

Be it known that I, JABEZ M. WOODWARD, of the city, county, and State of New York, mechanical engineer, have invented certain 5 new and useful improvements in the manner of preparing and constructing mattresses for berths and state-rooms and in the supporting bars or frames forming the bottoms of the berths for the purpose of their 10 being combined and readily converted into boats or life-rafts for saving passengers in cases of emergency, useful chiefly in ocean steamers or other large ocean vessels used for the transportation of passengers; and 15 that the following is a full and exact description of my said improvements and of the manner of constructing the same and of converting the same into boats, reference being had to the accompanying drawings, 20 making part of this my specification.

The object of my invention and improvements is to provide on board ocean and coasting steamers and vessels carrying large numbers of passengers on voyages a safe and 25 reliable means for preserving life in case of the sinking of the vessel independent of the ordinary boats and life-boats so called, and which means can be used and applied without encumbering the vessel, or adding 30 to the ordinary expense of fitting out. To effect this object, I propose to use the mattresses of the berths, and the bottoms or supporting frames of the berths, constructed and prepared in the manner hereinafter de-35 scribed and capable of being put together in a few minutes by the ordinary seamen of the vessel so as to form a buoyant and safe boat or life-raft. In the accompanying drawings, Figure I, 40 represents the bottom or under side of a ship's mattress and of the stout sheet of canvas or duck sewn upon it, and the eyelet holes in the canvas. Fig. II, is the opposite side of the mattress. Fig. III, is the side | together with the two longest sides in con-45 edge with a part of the canvas raised. Figs. IV and V, represent the manner of constructing the supporting strips or bottom frame of the berth. Fig. VI, is a cross section through the center of a boat composed 50 of the mattresses and frames and put together according to my plan. Fig. VII, is a top view or plan of the boat as constructed of the mattresses, frames and fastenings.

mattress and manner of binding them to- 55 gether.

In all the figures the same letters represent the same parts.

I construct the mattress in shape, size, and thickness like the ordinary berth mattress; 60 but instead of filling them with hair or feathers, I use for a filling some material which shall be comfortable and suitable for sleeping upon, and shall at the same time be buoyant in the water; and I prefer for this 65 purpose cork shavings, because they are soft, durable and elastic, and free from dirt or vermin, and also have great lightness and buoyancy; these mattresses are usually about six feet in length; two feet six inches in 70 width, and six inches thick.

Upon one (the under) side of the mattress is sewed a piece of strong duck or canvas which covers the mattress on that side except a narrow border all around; and 75 at the edges of the piece of canvas are eyelet holes all around strongly stitched and hemmed so as to bear the lacing and strain of a rope through them as shown in Fig. I, abeing the mattress, b, the canvas, 1, 2, 3, &c., 80being the eyelet holes. These mattresses are to form the bottom and sides of the boat—and will answer very well for this purpose, without any other materials in addition than the ropes which 85 are to bind them together. For stiffening the boat and forming a diaphragm floor upon the inside upon which the passengers and stores and water may be placed, I use the bottom boards or frames 90 of the berths, and any spar such as is always at hand on board any steamer or vessel. For this purpose the supporting pieces of the berths should be made into two frames of a right angled and triangular shape as 95 shown in Fig. IV, c, c, which when put tact will form an oblong square, as in Fig. IV; but when placed together with the longest sides outward and with the two acute 100 angles in contact they will form a triangle as seen in Fig. V. The object of this arrangement is to form a frame and diaphragm of the requisite sharpness for the bow and stern of the boat, the intermediate part of the dia- 105 phragm and frame being laid in a rectangu-

lar form as in Fig. IV and Fig. VII. These frames should be of open work in squares or parts of squares as shown in the drawings.

To give the boat when put together stiff-5 ness between stem and stern I use a spar seen in section in Fig. VI, at d, and running the whole length of the boat from bow to stern.

To construct the boat of the mattresses the boat perfectly tight and impervious to 10 they are laid upon the deck with the canvas water, a cover of oiled cotton cloth should be 60 side upward; a sufficient number to form a boat, say about twenty-five feet in length. The mattresses being laid with their ends provided on board the vessel, to be ready at hand in case of emergency. This would make the boat as dry as the best constructed edge to edge, the whole length, a rope of suitboat could be. These boats will not easily 15 able size is passed through the eyelet holes be injured by coming in contact with timber 65 of each contiguous sheet of canvas attached or rocks; or by the force of the waves; and to the mattresses, and drawn tight so as to requiring no additional expense or room for lash the ends of the mattresses into close the materials out of which they are concontact, as seen at i, i, Fig. VI. The matstructed than what are necessary for other 20 tresses thus lashed, are then turned over with their canvas sides outward; the spar d, is objects in all ocean vessels carrying passen- 70 then laid, in the middle along the whole gers, will afford to the passengers a sense of length, and to the spar d, are lashed and sesecurity and means of escape in cases of foundering of the vessel, not heretofore atcured the berth frames arranged as shown 25 at Figs. IV and V and Fig. VII. The mattainable. tresses are then lashed together by the eye-Having thus described my invention and 75 lets at the sides, the length of the sides of manner of constructing the same, and putthe boat as shown in section Fig. VI, and in ting the same into use—what I claim in the foregoing, and for which I desire Letters side elevation Fig. VIII. Where the boat 30 diminishes in size at the ends by the sharpen-Patent, is: 1. The constructing the mattresses with 80 ing of the bow and stern the mattresses are the strong canvas or duck attached to them drawn together at their upper ends by the with the eyelet holes so that they can be lashings as seen in Fig. VII. A strengthening rope should be passed united at their edges by lashings, for the 35 around the whole length of the inside of the purposes of making a boat or life raft as above described. boat, at the gunwales, through rings or loops attached to the mattresses as shown in Fig. 2. I claim the manner of constructing the berth bottoms or supports into frames in the VII at k, k, k. These loops or rings may be shape of or similar to right angled triangles permanently fixed to the mattress when in combination with the mattresses con-40 made, or may be drawn through between each mattress and fastened to the outer lashstructed as above described. 3. The combination of the mattresses canings, when the boat is put together. Atvas and eyelets, with the lashings diaphragm tached to the loops, or to the gunwale rope frames and spar arranged into the form of are ropes for fastening at the other end to 45 the diaphragm floor frames to hold them in a boat or life raft as described. J. M. WOODWARD. place. By drawing the lashings as above de-Witnesses: scribed strongly together, the spaces between I. B. STAPHS, the mattresses will be made water tight, or I GEO. W. Fox.

sufficiently so, for security—and if there 50 should be leaks the buoyancy of the mattresses will keep the boat afloat with her complement of passengers and stores.

A boat thus constructed twenty-five feet long will carry twenty-two passengers and 55 water and provisions for thirty days, and room to spare.

If it should be thought desirable to have
