United States Patent Office.

CHARLES PHILIPP LENZ, OF POUGHKEEPSIE, NEW YORK.

Letters Patent No. 100,776, dated March 15, 1870.

IMPROVED EXTENSION TABLE.

The Schedule referred to in these Letters Patent and making part of the same.

To all whom it may concern :

Be it known that I, CHARLES PHILIPP LENZ, of Poughkeepsie, in the county of Dutchess, and State of New York, have invented a new and improved Extension Table; and I do hereby declare that the following is a full, clear, and exact description thereof, which will enable others skilled in the art to make and use the same, reference being had to the accompanying drawing forming part of this specification.

Figure 1 represents a side elevation of my improved extension table.

Figure 2 is a vertical transverse section of the same, taken on the plane of the line *x x*, fig. 1.

Similar letters of reference indicate corresponding parts.

This invention has for its object to so improve extension tables that the same will constitute a receptacle for the table-covers, napkins, and other articles used on the table.

The invention consists in combining a bureau or case, containing drawers or shelves, with the table, the said bureau or case forming the support of the middle set of rails, and being thereby out of the way, and almost entirely out of sight.

A A in the drawing are the ends of an extension table of suitable form, size, and construction.

B B are the extension rails of the same, B' being

the middle set of rails, which is usually supported by a central standard or leg.

I employ four legs, C C, for supporting the middle set of rails.

The four legs are arranged to form the corners of a bureau or case, D, which is built up between them, as shown.

This bureau or case is either provided with drawers, or with doors and shelves. It is a convenient receptacle for all articles that are frequently used on the table.

The several legs of the table, including those of the bureau, are to be provided with casters, in the ordinary manner. If one of the casters should be lost, there will still be a sufficient number to hold the table steady.

Having thus described my invention,

I claim as new, and desire to secure by Letters Patent—

The combination of an extension table with a bureau or case, supporting the central pair of extension rails, as set forth.

CHARLES PHILIPP LENZ.
