UNITED STATES PATENT OFFICE.

THEODORE W. KREITZ, OF QUINCY, ILLINOIS.

IMPROVEMENT IN CIGARS.

Specification forming part of Letters Patent No. 127,172, dated May 28, 1872.

To all whom it may concern:

Be it known that I, THEODORE W. KREITZ, of the city of Quincy, in the county of Adams and State of Illinois, have made certain new and useful Improvements in Cigars, of which the following is a specification, reference being had to the accompanying drawing.

Nature and Object of the Invention.

The invention relates to cigars manufactured in the usual manner; and consists in providing the mouth end of a cigar with a binding of thread or other like material to prevent the end of the cigar soaking or becoming unrolled, and at the same time to avoid the necessity of cutting off or opening the said end.

Description of the Accompanying Drawing.

Figure 1 is a view of a cigar provided with the invention. Fig. 2 is an enlarged view of same, showing the manner of securing the thread C.

General Description.

A in the accompanying drawing represents a cigar of ordinary construction. B is the mouth end thereof. C is a piece of thread, which is placed upon the mouth end in such manner as to bind the wrapper against the filling. A common needle of proper dimensions is provided with the thread C, and at the proper distance from the end of the cigar is forced directly through it. The thread is drawn through the orifice, a portion of it being left on the side of the cigar where the needle entered. The thread is then drawn through the cigar at a point midway between the orifices made, as aforesaid. This serves to bind one portion of the surface of the mouth end. The thread is

then again drawn through the orifice first made, and thence brought round the mouth end in a direction opposite to that mentioned in connection with the first perforation; thence through the second orifice, and finally knotted to the end of the thread remaining outside of the aperture first made. Thus the mouth end of the cigar is provided with a binding of thread, serving to hold the wrapper in position, to preserve the end of the cigar in shape, and at the same time allow it to be lighted and smoked by means of the orifices made by the needle or other instrument in drawing the thread through the end B. The end B may be secured in like manner by passing the thread over the cone of the end B instead of around it, as above stated; or the thread may be passed both around the end B and over the cone, as preferred.

It is obvious that less than four orifices can be used, as it is only necessary to pass the thread through an orifice in the mouth end of the cigar and then make it fast about or over such end.

Claim.

What I claim as my invention, and desire to secure by Letters Patent, is—

As a new article of manufacture, a cigar having its mouth end B bound with thread, substantially as shown and described.

In testimony that I claim the foregoing improvements in cigars, as above described, I have hereunto set my hand and seal this 16th day of February, 1872.

THEODORE WM. KREITZ. [L. S.]
