H. J. DAVIES. Clock-Case.

No. 161,211.

Patented March 23, 1875.

THE GRAPHIC CO.PHOTO-LITH.39 & 41 PARK PLACE, N.Y.

UNITED STATES PATENT OFFICE.

HENRY J. DAVIES, OF BROOKLYN, NEW YORK.

IMPROVEMENT IN CLOCK-CASES.

Specification forming part of Letters Patent No. 161,211, dated March 23, 1875; application filed January 28, 1875.

To all whom it may concern:

Be it known that I, Henry J. Davies, of Brooklyn, in the county of Kings and State of New York, have invented a new and useful Improvement in Clocks; and I do hereby declare that the following is a full, clear, and exact description thereof, reference being had to the accompanying drawing forming part of this specification:

My invention consists of an entablature arranged in an elevated position, and constructed to receive and support the clock-works, and also to support a glass shade arranged over and inclosing said clock-movement, as will

more fully hereafter appear.

Having given a general description of my invention, I will now proceed to describe it in detail, making reference to the particular example of my invention, which is illustrated in the accompanying drawing.

Figure I in this drawing is a front view of a clock embodying my invention, and Figure 2 is a central transverse vertical section through the case of the same.

Similar letters of reference indicate corre-

sponding parts in both figures.

The elevated entablature may be supported in various ways, for instance, by columns or legs or a suitable case or stand; but, in the example of my invention, which is illustrated in the drawing, an entablature, A, is supported in an elevated position by ornamental columns B, erected on a surface, plinth, or pedestal, C. A clock movement of any suitable construction is mounted on this entablature. The movement D, which is shown in the drawing, has an ornamental face or front plate. Above this entablature I arrange a glass shade, so as to inclose the clock movement. The shade employed for this purpose may be of any suitable form—for instance, dome-shaped, like the shade E represented in

the drawing—and it may rest directly on the entablature, like the shade E, or it may be elevated on some intermediate contrivance. When a bell is used, it may be arranged in any suitable manner within reach of the clapper or hammer. The drawing represents a bell, F, as being arranged on the under side of the entablature A and a clapper, G, as extending through an opening, a, in the entablature to operate such bell. The pendulum H is suspended below the entablature by a rod, I, which passes through the opening a in the said entablature, and below the entablature is arranged a case, J, having glazed front and sides, which permit the pendulum to be seen, and a mirror is or may be arranged at the back to reflect the pendulum and enhance the appearance of the clock.

By means of this invention I am enabled to produce clocks of highly ornamental and tasteful appearance at a very moderate cost, so that they can be sold for a low price, within the means of even the poorer classes.

What I claim as my invention, and desire to

secure by Letters Patent, is-

1. The entablature A, arranged in an elevated position, and constructed to receive and support the clock-work, and the glass shade, arranged over and inclosing the clock-movement, as and for the purpose described.

2. The elevated entablature, constructed to receive and support the clock-movement and the glass shade inclosing said movement, the pendulum of the clock passing downwardly through said entablature, and vibrating within a case below the entablature, as and for the purpose described.

HENRY J. DAVIES.
