UNITED STATES PATENT OFFICE.

ALEXANDER W. STEWART, OF BOSTON, ASSIGNOR TO JOHN J. HALEY, OF
NEWTON, AND HENRY C. MORSE, OF BOSTON, MASSACHUSETTS.

IMPROVEMENT IN CARPET-SWEEPERS.

Specification forming part of Letters Patent No. **166,232**, dated August 3, 1875; application filed
June 27, 1874.

To all whom it may concern:

Be it known that I, ALEXANDER W. STEWART, of Boston, Massachusetts, have invented certain Improvements in Carpet-Sweepers, of which the following is a specification:

My invention consists in the combination, with the brush-shaft and end-board of a carpet-sweeper, of a box or bearing for the spindle of the brush-shaft, which box is so mounted that it can be readily moved away from the spindle in order to disengage the spindle from it, and thereby remove the brush, and also readily moved toward the spindle in order to cause it to re-enter the box and thereby replace the brush.

In the drawings, A represents the movable box or bearing for the spindle, B the brush-shaft, and C the end board.

In Figures 1 and 2 the brush-shaft must be inclined and the box swung round on the pivot *a*, in order to insert the brush; then, if the brush-shaft and the box be moved together into place, as indicated by the dotted lines, the spindle will gradually enter the box, as will be clear without further explanation.

In Fig. 3 the set-screw *b* must be loosened and the brush-shaft inclined as before, and the box A brought into such a position that the spindle will enter it. Both are then brought into place together, and secured there by the set-screw *b*.

This set screw is not required in Fig. 1, as the plate A, forming the movable box, is broadened at the top, and comes in immediate contact with the cover when it is closed, and is by it held with sufficient steadiness to secure a proper working position to the brush.

What I claim as my invention is—

The adjustable bearing-plate A, pivoted to the end of the box, or slotted, and held by a set-screw, and adapted to receive and release the spindle B of the brush-shaft, and to hold it firmly against displacement when brought into a proper working position, substantially as set forth.

ALEXR. W. STEWART.
