A. SHIELS. Invalid Lounge.

No. 167,700.

Patented Sept. 14, 1875.

UNITED STATES PATENT OFFICE.

ANDREW SHIELS, OF PORTLAND, OREGON.

IMPROVEMENT IN INVALID-LOUNGES.

Specification forming part of Letters Patent No. 167,700, dated September 14, 1875; application filed June 12, 1875.

To all whom it may concern:

Be it known that I, Andrew Shiels, of Portland, in the county of Multnomah and State of Oregon, have invented a new and Improved Lounge, of which the following is a specification:

specification:

The invention relates to certain improvements in lounges; and consists in the combination, with the hinged bottom boards, of devices which enable the patient to adjust himself either from a recumbent to a sitting posture, or vice versa, without assistance.

Figure 1 is a plan of the bottom of the improved lounge. Fig. 2 is a rear side elevation, and Fig. 3 is a longitudinal vertical sec-

tion taken on the line x x.

Similar letters of reference indicate corre-

sponding parts.

The middle portion A of the bottom of the lounge is stationary. The portion B between it and the head is made in one piece and hinged to it. The portion C, between A and the foot, is made in two pieces, which are hinged together, and the upper one is hinged to the piece A. D is a crank, under B, for raising it by the lever-handle E. F is a crank, under part C, for raising it by the arms G and lever H. I represents ratchet-bars, to hold the cranks in different positions. J represents legs, hinged to the under side of part B of the bottom, for holding it in a more upright position than the crank will, to support the patient in a sitting position. K is a book-rack, mounted on the swinging arm L, over the lower

portion of the lounge, for the convenience of the occupant when supported in a sitting position by the back-rest B. The arm L is provided with a ratchet-bar, M, for holding it any required distance from the sitter.

The levers H and E are arranged so that the occupant of the lounge can adjust the bot-

tom while lying on it.

The apparatus is simple, can be easily operated, and is calculated to afford a very useful

lounge for invalids and others.

I am aware of the fact that lounges for invalids have been constructed with the backrest and foot portion hinged, in a manner similar to mine; and I therefore limit my invention to the particular devices for enabling the patient to adjust his lounge to suit himself, and without assistance.

Having thus described my invention, I claim as new and desire to secure by Letters Pat-

ent—

1. The combination, with the hinge portion B, and the hinged legs J, of the crank D, lever-handle E, and ratchet-bar I, substantially as and for the purpose described.

2. The combination, with the double-hinged portion C, of the crank F G, ratchet-bar I, lever-handle H, and connecting-rod, as and for

the purpose described.

ANDREW SHIELS.
