UNITED STATES PATENT OFFICE

FRANZ KUEHNE, OF AUSTIN, TEXAS, ASSIGNOR OF ONE-HALF HIS RIGHT TO FRANCIS B. FORSTER, OF NEW YORK, N. Y.

IMPROVEMENT IN PAPER BOXES.

Specification forming part of Letters Patent No. 174,541, dated March 7, 1876; application filed December 29, 1875.

To all whom it may concern:

Be it known that I, Franz Kuehne, of Austin, in the county of Travis and State of Texas, have invented a new and useful Improvement in Paper Boxes, which improvement is fully set forth in the following specification, reference being had to the accompanying drawings:

Figure 1 represents a paper blank ready for folding into a box. Fig. 2 is the blank partially folded; and Fig. 3 is a representation of the folded box, showing the tongue as

tucked into the slits.

The dotted lines in Fig. 1 indicate impressions or slight cuts to facilitate the bending of the paper into the shape of a box. The solid lines 1 2 represent clear cuts through the paper to permit folding the sections p p' inwardly to form the ends of the box when the side pieces r are turned up on lines 6 6. The slit a b is made to correspond with the opposite tongue at e d, which is formed by the cuts at e d and e f. The pieces e and e must be folded over outwardly, so that the tongue e0 will pass through the slit e1 when the sides are folded at 5 6, and, when through, the pieces e1 and e2 can be straightened out

again, and thus retain the tongue in place. The slits i k and g h are made to correspond with the tongue o, and when the parts A B are folded over at the dotted lines 3 and 4, the tongue o is to be passed outwardly through the slit i k, and again returned through slit g h, so that when these folds are made the end of tongue o will be concealed and protected from injury, and the box will have been completed, as shown in Fig. 3.

I claim as my invention—

As a new article of manufacture, the box herein described, made from a single piece cut blank, consisting of a principal or body portion, which forms, in folding, the sides of the box, and from which project correspondingly-attached top and bottom flap-pieces oppositely located, and intermediate locking straps or tongues; the entire blank being folded along the dotted lines, and the tongue-pieces d e and o, passed through their corresponding slits a b, i k, and g h, lock and complete the box, substantially as herein described.

FRANZ KUEHNE.
