UNITED STATES PATENT OFFICE.

CHARLES B. BRISTOL, OF NEW HAVEN, CONNECTICUT.

IMPROVEMENT IN CURRY-COMBS.

Specification forming part of Letters Patent No. **180,749**, dated August 8, 1876; application filed July 24, 1876.

To all whom it may concern:

Be it known that I, CHARLES B. BRISTOL, of New Haven, in the county of New Haven and State of Connecticut, have invented a new Improvement in Curry-Combs; and I do hereby declare the following, when taken in connection with the accompanying drawings and the letters of reference marked thereon, to be a full, clear, and exact description of the same, and which said drawings constitute part of this specification, and represent, in—

Figure 1, a perspective view of the upper side; Fig. 2, a perspective view of the under side.

This invention relates to an improvement in the article known to the trade as "Curry-Combs;" the object being the production of a cheap but serviceable and durable article. It consists in a metal frame, with teeth cast upon the outer bars, combined with an intermediate sheet-metal flanged bar, as more fully hereinafter described.

A A are the two sides, and B B the two

ends, of a cast-metal frame, with a shank, C, cast thereon for the handle. Upon the under side of the two outside bars A A a series of vertical teeth, *a*, are formed in casting. Intermediate between these two outer bars is a longitudinal sheet-metal bar, D. This bar is constructed with a flange, *d*, upon the edge, and on the edge of the flange teeth are cut, as seen in Fig. 2; but these may be one with teeth and the other plain, or both plain, or both with teeth. This bar is riveted to the frame, and thus completes the comb.

I claim—

As an article of manufacture, the curry-comb, consisting of a substantially-rectangular cast-metal frame, with teeth formed upon the under side of the two sides, combined with an intermediate flanged bar, substantially as set forth.

CHAS. B. BRISTOL.
