UNITED STATES PATENT OFFICE.

AARON MILLER, OF BROCKPORT, NEW YORK.

IMPROVEMENT IN HARVESTING-MACHINES.

Specification forming part of Letters Patent No. **182,030**, dated September 12, 1876; application filed April 7, 1876.

To all whom it may concern:

Be it known that I, AARON MILLER, of Brockport, Monroe county, and State of New York, have invented a new and useful Improvement in Harvesting-Machines, which improvement is fully set forth in the following specification, reference being had to the accompanying drawings.

The object of this invention is to give firmness to the finger-bar and platform of harvesting-machines; and this I obtain by constructing a tubular finger-bar with flanges on two sides, the flanges being for the purpose of fastening the guards and platform to the bar.

The finger-bar may be constructed of two separate bars rolled in the form represented at Fig. 4, (Figs. 3 and 4 being sectional views, Figure 1 being a plan, and Fig. 2 a rear view,) the rear edges being fastened together with rivets, the bolts that fasten the guards hold-

ing the front edges together; or the bars, after being formed as shown at Fig. 4, may be heated and passed through rollers and welded, as shown at Fig. 3.

When the grain-wheel is placed at some distance in the rear of the finger-bar in a harvesting-machine there is a twisting strain or torsion to the finger-bar, and an unsteady vibrating motion to the platform. This tubular form being given to the finger-bar imparts strength to resist torsion and give steadiness to the platform.

I claim as my invention—

A tubular finger-bar having flanges projecting from the front and rear thereof, substantially as described.

AARON MILLER.
