UNITED STATES PATENT OFFICE.

EZRA WEBB, OF BROOKLYN, NEW YORK, ASSIGNOR TO MRS. S. E. SHUTTER,
OF NEW YORK CITY.

IMPROVEMENT IN PROVISION-SAFES.

Specification forming part of Letters Patent No. **189,159**, dated April 3, 1877; application filed
September 16, 1876.

To all whom it may concern:

Be it known that I, EZRA WEBB, of Brooklyn, in the county of Kings and State of New York, have invented a new and useful Improvement in Safe and Refrigerator for Windows, of which the following is a specification:

Figure 1 is a front view of my device shown as applied to a window. Fig. 2 is a vertical cross-section of the same. Fig. 3 is a front view of the same, the doors being shown open.

The object of this invention is to furnish a device to be placed in a window when there may be a scarcity of closet-room, to receive cooked and uncooked provisions, and which shall be so constructed that it may serve also as a refrigerator.

The invention will first be described in connection with the drawing, and then pointed out in the claim.

A is the safe, which has wire cloth in its front and back, so that the air may pass through it freely. The top of the safe A is made inclined, so that the rain may run off it freely. The front of the safe A may be provided with a single door or with double doors, as may be desired.

The interior of the safe is divided into two unequal compartments by a partition, *a'*. The larger compartment may be provided with shelves B, to receive the various articles to be kept, and may have hooks attached to its top to receive such articles as require to be hung up. In the bottom of the smaller compartment is placed a pan, C, in which may be placed a rack to receive ice, shelves being placed in the upper part of the said compartment.

If desired, a small refrigerator, E, may be placed in the smaller compartment, in the upper part of which is placed the ice-chamber, and in the lower part of which may be placed articles that require to be kept cold.

The ice-chamber of the refrigerator E has a door, *e*¹, in its top opening upward, and a door, *e*², in front opening outward, so that the ice can be conveniently put in and can be conveniently broken with an ice-pick when required. The lower part of the refrigerator E is also provided with a door, *e*³, for convenience in putting in and taking out articles.

The drip-water from the ice-chamber may be received in a pan or other receptacle, or may be conducted away by a pipe.

The inner part of the bottom of the safe A rests upon the window-ledge, and the safe is secured in place by chains F, the outer ends of which are attached to the outer parts of the ends of the said safe, and their inner ends are attached to the window-frame. The safe will thus be securely held in place, and will not interfere with the raising and lowering of the window sashes.

The safe may be secured in the window by screws, bolts, or other fastenings, if desired.

Having thus described my invention, I claim as new and desire to secure by Letters Patent—

A safe, A, provided with wire cloth in its front and rear, with an inclined top, and with chains F, to adapt it to be applied to a window, substantially as herein shown and described.

EZRA WEBB.
