Inventor:

Eugene F. Goodman.

UNITED STATES PATENT OFFICE.

EUGENE F. GOODMAN, OF LOCKPORT, NEW YORK.

IMPROVEMENT IN HAMMERS.

Specification forming part of Letters Patent No. **206,394**, dated July 30, 1878; application filed—
November 26, 1877.

To all whom it may concern:

Be it known that I, EUGENE FRANKLIN GOODMAN, of Lockport, in the county of Niagara and State of New York, have invented a new and useful Improvement in Hammers, which improvement is fully set forth in the following specification, reference being had to the accompanying drawings.

The object of my invention is to admit of the nail being drawn by the claws when the nail-head is driven in even or slightly below the surface of the wood, by making the claws shorter and straighter than those of an ordinary carpenter's hammer, and of a curved and tapering wedge shape on the outside. The

slot is also shorter than is ordinarily made, being graduated in size, so as to draw various sizes of nails, whether the head is raised or sunk into the wood.

The accompanying drawing will probably be easily understood without reference-letters.

I claim as my invention—

A hammer, substantially as described, having pointed claws beveled to an edge on the outside along the slot.

EUGENE FRANKLIN GOODMAN.
