# UNITED STATES PATENT OFFICE.

WILLIAM E. O'BRYON, OF IONIA, MICHIGAN.

## IMPROVEMENT IN CASES FOR WRITING-TABLETS.

Specification forming part of Letters Patent No. **209,417**, dated October 29, 1878; application filed July 20, 1878.

*To all whom it may concern:*

Be it known that I, WILLIAM E. O'BRYON, of the city of Ionia, in the county of Ionia and State of Michigan, have invented a new and useful Improvement in Cases for Writing-Tablets, being a device for putting up and securing stationery, such as letter-heads, bill-heads, &c., of which the following is a specification:

This device consists of a box made in two sections, A and B, joined together at the back ends by a cloth or leather hinge, which, when closed, has the appearance in form of an ordinary book.

Section A is made as follows: Take a piece of heavy binder's board, or other similar material, about one-fourth inch longer and wider than the stationery to be inclosed, to the two sides and one end of which attach, by means of glue or other adhesive substance and stays of cloth, strips of the same material, *a a a*. These strips should be as wide as the desired depth of the box. Take of the same material a piece large enough to form a projecting edge of one-fourth inch at either side and one end of the above specified part, and glue the two parts together firmly, with the strips *a a a* projecting outward.

Section B is made of the same material and in the same form as section A, except that

the sides *b b* are fractional, extending from the end about two inches, and the bed-piece, to which the end and fractional sides are attached, should be cut of the exact size of the stationery to be inclosed.

The open end of the section A is connected by a flexible hinge, *c*, of cloth or leather, to the upper edge of the end piece *a'* of the section B, thus allowing the covering section A to be lifted and thrown back, as shown.

The whole may be covered with paper or cloth, and embellished to please the taste.

For practical use, attach the tablet of stationery with glue or paste to the bottom and end of section B, in such manner as to hold it firmly to its place and allow each sheet to be detached as used.

What I claim is—

The case for holding writing-tablets, consisting of the section A, having rigid side and end pieces *a*, and the section B, having rigid back pieces *a'* and fractional side pieces *b*, between which latter fits the head of the tablet, the two sections being connected by a flexible joint, *c*, substantially as described.

WILLIAM E. O'BRYON.
