UNITED STATES PATENT OFFICE.

NELSON PARKER, OF LITTLETON, NEW HAMPSHIRE, ASSIGNOR OF ONE.
HALF OF HIS RIGHT TO CHARLES PARKER, OF SAME PLACE.

GLOVE.

SPECIFICATION forming part of Letters Patent No. 235,009, dated November 30, 1880.

Application filed September 7, 1880. (No model.)

To all whom it may concern :

Be it known that I, NELSON PARKER, of Littleton, county of Grafton, State of New Hampshire, have invented a new and useful
5 Improvement in Gloves; and I hereby declare the following to be a full, clear, and exact description thereof, reference being had to the accompanying drawing, making part of this specification, in which the figure shows a glove
10 with my improvement attached.

My invention relates to button-top gloves; and it consists in attaching to the back of the glove a re-enforce or wrist-piece, which shall
15 tend to the button or button-hole portion.

To enable others skilled in the art to make and use my invention, I will proceed to describe the exact manner in which I have carried it out.

20 In gloves heretofore made with a wristband the wrist-piece has been made to extend entirely around the glove and cover both the button-piece and the button-hole, thus presenting a double thickness of material through
25 which the button has to pass.

The object of my invention is to overcome this difficulty, and at the same time secure a

better finish to the glove with a great saving of stock, labor, and expense.

In the drawings, A represents a glove, and
30 B my improved wrist-piece, extending across all the seams of the glove, but not extending over the part where the button is attached or where the button-hole is made. This gives a better finish to the glove and wrist and to the
35 general appearance of the glove, and presents but a single thickness of the material through which the button has to pass in buttoning the glove upon the hand.

I am aware that wristbands upon gloves are
40 not new, nor do I claim such broadly; but

What I claim as new, and desire to secure by Letters Patent, is—

In combination with the glove A, the wristband or re-enforce B, secured to the glove along
45 all its edges, and of length less than the width of the glove, whereby the point for securing the button and the button-hole are left of a single thickness of material, as herein set forth.

NELSON PARKER.
