United States Patent Office.

FRANK S. NEWBY, OF INDIANAPOLIS, INDIANA.

ADVERTISING DEVICE.

SPECIFICATION forming part of Letters Patent No. 262,240, dated August 8, 1882.

Application filed May 27, 1832. (No molel.)

To all whom it may concern:

Be it known that I, FRANK S. NEWBY, a citizen of the United States, residing at Indianapolis, in the county of Marion and State of Indiana, have invented a new and useful Advertising Device, of which the following is a specification.

My invention relates to such advertisements or advertising-bills as have been heretofore 10 distributed on the streets by persons throwing the same in the air. This method does not sufficiently separate the bills so that the wind can distribute them, nor does it especially attract the attention of passers-by. I overcome 15 these objections by the following device: Between two packages of advertising-bills I place a fire-cracker or a package filled with explosive matters. I then bind the whole together by a thin band or string that is easily 20 broken. To give weight to the package in order to throw it high in the air, a stiff cover may be folded around package, or blocks may be placed between the advertising packages, said blocks to consist either of two pieces 25 about the size of the packages, with a groove to receive fire-crackers, as shown by Figure 2, or to be small blocks at each side of fire-crackers, as shown in Fig. 4. Another method is shown by Fig. 5, where the advertising-bills 30 are simply wrapped around the fire-cracker and held together by a thin band or string.

Fig. 3 shows a method of inclosing the fire-cracker and advertising-bills at two sides and one end by a stiff cover, which is fastened together at the other end by a thin band or string or any other manner of fastening that can be easily broken.

In the accompanying drawings, in which similar letters of reference refer to similar parts throughout the several views, Figure 1 is 40 a perspective view of the device; Fig. 2, a vertical section through the same. Figs. 3, 4, and 5 show a few different ways of arranging the parts forming the device.

A A are packages of advertising-bills.

B is a fire-cracker or a package filled with explosive matter, with a slow match.

C is a thin wrapper, band, or string to secure the advertising-bills around the fire-cracker. D D are blocks to give weight and strength 50

to the package.

E in Fig. 3 is a stiff cover inclosing advertising-bills and fire-cracker.

When the slow match is lighted and the package thrown in the air the explosion of the 55 fire-cracker will distribute the advertisingbills, at the same time attracting the attention of passers-by.

What I claim as my invention, and desire to secure by Letters Patent, is—

For advertising purposes, the combination of an explosive package, B, advertising-bills A A, fastening C, and blocks D D, substantially as described, and for the purpose set forth.

In testimony whereof I have signed my 65 name to this specification in the presence of two subscribing witnesses.

FRANK S. NEWBY.
