UNITED STATES PATENT OFFICE.

HENRY J. ERWIN, OF MARYSVILLE, OHIO.

EAVES-TROUGH HANGER.

SPECIFICATION forming part of Letters Patent No. 270,038, dated January 2, 1883.

Application filed April 29, 1882. (No model.)

To all whom it may concern:

Be it known that I, HENRY J. ERWIN, a citizen of the United States, residing at Marysville, in the county of Union and State of Ohio, have invented certain new and useful Improvements in Eaves-Trough Hangers; and I do hereby declare the following to be a full, clear, and exact description of the invention, such as will enable others skilled in the art to which it appertains to make and use the same.

My invention relates to certain new and useful improvements in the class of eaves-trough hangers having for its object the production of a cheap and simple hanger by which the eaves-trough can be easily and readily secured in position, and also removed, when desired, for repair or replacing by a new one; and to this end the invention consists in a novel construction of hanger, as will be hereinafter fully described, and set forth in the claim hereto annexed.

Referring to the accompanying drawings, Figure 1 is a side elevation. Fig. 2 is a cross-section, and Figs. 3 and 4 are detail views.

In the drawings, A represents the eaves-trough, and B the cross-bar of the hanger, provided with the usual strap, C, by which the hanger is attached to the roof.

D represents a metallic band encircling the

body of the eaves-trough transversely, and has at its ends T-shaped heads *d*, adapted to enter corresponding slots, *b*, in the cross-bar B, near its ends, whereby the elasticity of the metallic band D will spring back said heads *d*, so that the ears *d'* thereof will rest on the upper side of cross bar B, thus securing the trough in position.

The above-described hanger combines simplicity and cheapness in construction, while permitting the eaves-trough to be easily and readily attached to or detached therefrom.

Having thus fully described my invention, what I claim as new, and desire to secure by Letters Patent, is—

The herein-described eaves-trough hanger, consisting of the encircling metallic band D, having T-shaped heads *d* at its ends, and the cross-bar B, provided with corresponding holes or slots *b* for the reception of the heads *d* and the securing-strap C, substantially as specified.

In testimony whereof I affix my signature in presence of two witnesses.

HENRY J. ERWIN.
