# UNITED STATES PATENT OFFICE.

ISRAEL S. SMITH, OF WASHINGTON, DISTRICT OF COLUMBIA, ASSIGNOR OF  
ONE-HALF TO EDWIN B. HAY, OF SAME PLACE.

## BILL-FILE.

SPECIFICATION forming part of Letters Patent No. 277,170, dated May 8, 1883.

Application filed December 13, 1882. (No model.)

*To all whom it may concern:*

Be it known that I, ISRAEL S. SMITH, of Washington, in the District of Columbia, have invented certain new and useful Improve-  
5 ments in Paper-Files; and I do hereby declare that the following is a full, clear, and exact description thereof, reference being had to the accompanying drawings, and to the letters of reference marked thereon, making a part of  
10 this specification.

This invention relates to means for holding papers for the purpose of filing them away to afford ready access to any paper; and the nature of my invention consists in the combina-  
15 tion, with a base-board, of looped standards, cross-heads applied thereto, and slotted holding-down plates, as will be fully understood from the following description, when taken in connection with the annexed drawings, in  
20 which—

Figure 1 is a perspective view of my improved file-holder. Fig. 2 is a vertical longitudinal section of a part thereof, and Fig. 3 is a vertical cross-section taken through the file-  
25 holder in the plane indicated by dotted line *xx* on Fig. 1.

In the drawings which I have annexed to this description I have shown two devices for holding papers down securely upon the board  
30 A. Both devices are exactly alike, although they are arranged in different lines. I prefer to use two; but one contrivance will in some instances answer the required purpose—to wit, securely holding down upon the board or  
35 back A letters, papers, or other matter which it may be desired to file and keep for ready reference.

B designates a standard, which is preferably made of wire of the open or looped form, and which has its lower part suitably secured  
40 to the board A. This standard presents two parallel bars perpendicular to said board, which are designed to form side stays, and also guides for the holding-down devices that will  
45 now be explained.

C designates a cross-head, which is perforated to receive through it the wires or bars constituting the standard B. This cross-head  
50 is slotted longitudinally, and the outer narrow lip, *a*, is upset so that it is in a plane ob-

tuse to the plane of the body of the cross-head. At the middle of the length of this cross-head, and rigidly secured to the said lip  
*a*, is a button, *b*. This button serves as a means for attaching a holding-down plate to  
55 the cross-head C, and it also serves, in combination with the latter, as a guide for the holding-down plate, which I now letter D. The plate D is slotted lengthwise, and it receives  
60 through its slot *c* the neck of the button *b*. This plate is passed transversely through the cross-head over the lip *a* and beneath the main portion of the cross-head. Plate D has free  
65 endwise movement, and it is designed for holding down the papers upon the board A. The holes *d d* through the ends of the cross-head C are circular, and they are somewhat  
70 larger than the diameter of the two parallel bars which constitute the standard B. The cross-head C is thus allowed to set obliquely to the standard-bars, so that when the hold-  
75 ing-down plate D is pressed upon the mass of paper in the file-holder the reaction of the mass will cause the holding-down plates to act as strong levers, the effect of which will be  
80 that the angles of the holes through the cross-head will bite on the bars of the standard and firmly hold. The cross-head is adjustable, and can be set at any desired point, according to the bulk of the papers which are filed on the  
board A.

It is obvious from what I have above explained that the holding-down plate is movable toward and from the board A, and that this holding-down plate is movable at right  
85 angles to the standard for the purpose of allowing the papers to be readily taken from the file.

I claim—

1. A file-holder composed of a base-board, 90 a vertical standard consisting of two parallel bars, a cross-head adapted to slide upon said bars and provided with a longitudinal slot and lip, and a slotted holding-down plate passing through said cross-head and under a button  
95 secured to the lip thereof, adapted to operate to hold the papers, substantially as specified.

2. The combination, in a file-holder, of the base-board A and the standards B, secured thereto, the cross-heads C, provided with lips 100

*a*, and upset, as described, the slotted holding-down plate *D*, and the button *b*, extending through the slot and secured to the lip *a*, the plate and cross-head being adapted to set in  
5 an oblique position when pressed upon the papers, substantially as and for the purposes specified.

In testimony whereof I affix my signature, in presence of two witnesses, this 20th day of September, 1882.

I. S. SMITH.
