United States Patent Office.

CORTLAND BALL, OF INDIANAPOLIS, INDIANA.

POLISHING-IRON.

SPECIFICATION forming part of Letters Patent No. 277,193, dated May 8, 1883.

Application filed August 14, 1882. (No model.)

To all whom it may concern:

Be it known that I, CORTLAND BALL, of Indianapolis, in the county of Marion and State of Indiana, have invented a new and useful Improvement in Polishing-Irons, of which the following is a specification.

Figure 1 is a perspective view, showing face and heel of iron. Fig. 2 is a longitudinal vertical section through iron.

o Similar letters of reference indicate like parts.

The object of my invention is to produce a polishing-iron that will impart a nice, smooth, even polish to linens without that hard laborious work which is required to accomplish the same by the polishing-irons heretofore used.

In order that those skilled in the art to which my invention appertains may be able to fully comprehend its nature, I will proceed to describe its construction.

A represents the body of my polishing-iron, made in the form of an ordinary sad-iron, though any other suitable shape may be substituted, and provided on its face B with ribs b b, which are cast solid to the iron when it is made. The heel of the iron is beveled, as shown at C and D. The bevel C, I make a little longer than bevel D. At the conjunction of the bevels the corner c is rounded a little,

as much as it can be without materially changing the angle of the bevels. The ribs b b b project about one-eighth of an inch below the face of the iron, or just sufficient to prevent the face B from coming in contact with the linens when polishing with them. If a finer polish is desired than can be obtained with the ribs b b, then either of the bevels C or D may be used, or a still higher finish may be imparted by using the rounded corners c, after using either or all of the other polishing surfaces.

My iron will prove to be of great convenience to housekeepers and laundresses, having four distinct polishing-places. It is well adapted for polishing shirts, collars, cuffs, &c. The linens should be well starched, and ironed 45 nearly, if not quite, dry before using the polishing-iron.

Having thus fully described my invention, what I claim to be new, and desire to secure by Letters Patent, is—

A polishing-iron having the rim b around its edge, the continuous triangular recess B, and the angles C D on its heel, substantially as shown.

CORTLAND BALL.
