UNITED STATES PATENT OFFICE.

ADILE C. PHILIPPI, OF NEW ORLEANS, LOUISIANA.

ATTACHMENT FOR COOKING-STOVES.

SPECIFICATION forming part of Letters Patent No. 349,118, dated September 14, 1886.

Application filed February 8, 1886. Serial No. 191,181. (No model.)

To all whom it may concern:

Be it known that I, ADILE CLAIRE PHILIPPI, of New Orleans, in the parish of Orleans and State of Louisiana, have invented a new and
5 useful Improvement in Attachments for Cooking-Stoves, of which the following is a specification, reference being had to the annexed drawings, forming a part thereof, in which—

Figure 1 is a plan view of a cooking-stove to
10 which my attachment has been applied. Fig. 2 is a front elevation.

Similar letters of reference indicate corresponding parts in both figures of the drawings.

The object of my invention is to provide a
15 simple and easily-applied attachment for supporting pots, kettles, and other cooking utensils at the edge of the stove-top and partly in contact therewith, for utilizing, in the operation of cooking, the heat which would otherwise
20 be lost.

My invention consists in a frame fitted to the stove-top and extending beyond the sides and ends of the stove in position to form, in conjunction with the stove-top, a support for cooking-vessels. Two bars, A B, of iron or other
25 suitable material, extend across the top of the stove, and are offset to receive cross-bars C, which are secured to the bars A B by means of rivets or otherwise, the upper surface of the bars C being level with the top of
30 the stove when the attachment is in position for use. The ends of the bars A B are returned upon themselves to form clips *d*, for engaging the edges of the stove-top and holding the attachment in place on the stove.
35

The form of the attachment will be varied to adapt it to different kinds of stoves. The bars A B will be made straight or curved, to allow them to extend over the top of the stove
40 without interfering with the ordinary use of the stove.

When it is desired to maintain the heat in articles cooked on the stove, the utensils in which they are cooked are removed from the

hotter parts of the stove-top, and are placed 45 partly upon the bars C and partly upon the edges of the stove-top.

The frame formed of the bars A B and the end pieces, C, instead of being made of separate pieces of wrought-iron riveted together, may be 50 formed integrally in a single casting; and instead of returning the ends of the bars A B upon themselves to form the clips *d*, I may secure the bars to the stove-top by means of rivets or bolts, and for some kinds of stoves the end 55 pieces, C, may be connected by bars extending under the stove-top, the ends of the bars being bent upward to support the cross-pieces C in position for use.

For convenience in handling the utensils 60 used in cooking, the bars A B may be prolonged beyond the cross-bars C, to receive other cross-bars, which will support the utensils in an accessible position.

My improved attachment economizes fuel, 65 as well as reduces the outlay in purchasing a stove, as a smaller-sized cooking-stove provided with the attachment will answer the purposes of a larger one, the heating-surface being materially increased. 70

Having thus described my invention, what I claim as new, and desire to secure by Letters Patent, is—

1. An attachment for the top of a cooking-stove, consisting of bars A B, having offsets 75 in their ends, and the cross-bars C, secured on the said offset ends of the bars A B, substantially as herein shown and described.

2. The combination of the longitudinal bars A B, offset at their ends and returned upon 80 themselves to form the clips *d*, and two or more bars, C, secured to the ends of the bars A B, substantially as herein shown and described.

ADILE C. PHILIPPI.
