# UNITED STATES PATENT OFFICE.

GEORGE PAVLIK, OF BOSTON, MASSACHUSETTS.

## GARMENT OR COAT HANGER.

SPECIFICATION forming part of Letters Patent No. 376,207, dated January 10, 1888.

Application filed March 23, 1887. Serial No. 232,134. (No model.)

*To all whom it may concern:*

Be it known that I, GEORGE PAVLIK, of Boston, in the county of Suffolk and State of Massachusetts, have invented certain new and useful Improvements in Garment or Coat Hangers, of which the following is a full, clear, and exact description.

This invention relates to that class of coat-supports which are composed of a hook or eye with which to hang or suspend it, and of extensions or arms from the opposite sides therefrom, and to be entered into the sleeve openings of the coat at the neck, and thereby to support the shoulders and also the neck portions of the garment.

The invention consists, in substance, of a coat-support of the class above stated, having its shoulder and neck sustaining arms or extensions made of sheet metal with a rolled-over edge, substantially as described.

In the drawings forming part of this specification, Figure 1 is a perspective view of the improved coat-support, and Fig. 2 is a section along the length of the same.

In the drawings, A is a hook or open eye at one end of a shank or stem, B, at its other end attached to the center of a strip of metal, having a curvilinear bend from end to end, D, and tapering in width from each end toward its middle and rounded or curved across its width. Each end, D, is rounded off, and the edge E of the strip is rolled over, and prefer-

ably upon, a wire core or rod, F, to stiffen and strengthen it. The hook or open eye A is the means through which to suspend the coat-support, in substance made of sheet metal, as has been described, and the extensions G at each side of the hook are inserted in the sleeve-openings of the coat at the neck and then the coat thereon supported, all as is well known without further description.

The coat-support described is simple, cheap, and efficient, and being made of sheet metal affords a closed surface for the rest of the shoulders and neck of the garment to which it has been applied, as stated.

Having thus described my invention, what I claim, and desire to secure by Letters Patent, is—

A coat-hanger in two parts, to wit: a continuous strip of sheet metal from end to end of an arch shape, narrower at its center than its ends, and at both ends rounded across its width, and its edge bent or rolled under and thereby rounded, and an eye or hook directly attached to said metal strip at its center, as herein described, for the purposes specified.

In testimony whereof I have hereunto set my hand in the presence of two subscribing witnesses.

GEORGE PAVLIK.
