# UNITED STATES PATENT OFFICE.

MARTIN YEAGLE, OF WATSONTOWN, PENNSYLVANIA, ASSIGNOR OF ONE-HALF TO ERASTUS D. BARTO, OF SAME PLACE.

## SHOE.

SPECIFICATION forming part of Letters Patent No. 384,224, dated June 5, 1888.

Application filed April 12, 1888. Serial No. 270,401. (No model.)

*To all whom it may concern:*

Be it known that I, MARTIN YEAGLE, a citizen of the United States, residing at Watson-  
town, in the county of North and State of Penn-  
sylvania, have invented certain new and use-  
ful Improvements in Shoes; and I do declare  
the following to be a full, clear, and exact  
description of the invention, such as will en-  
able others skilled in the art to which it apper-  
tains to make and use the same, reference be-  
ing had to the accompanying drawings, and to  
the letters and figures of reference marked  
thereon, which form a part of this specifica-  
tion.

This invention relates to shoes, and has for  
its object the production of a shoe especially  
adapted for lumbermen and those exposed to  
wet and damp ground, and whose calling nec-  
essarily subjects the shoe to hard and rough  
usage, that will exclude the dampness, stand  
the strain and hard wear, and, withal, be com-  
fortable, comparatively light, and neat in ap-  
pearance.

The improvement consists in the novel fea-  
tures, which hereinafter will be more fully de-  
scribed and claimed, and shown in the an-  
nexed drawings, in which—

Figure 1 is a perspective view of a shoe of  
my invention, and Fig. 2 a perspective view  
showing the parts detached and in their rela-  
tive positions.

The vamp A and the quarters B and B' are  
united by the usual side seams, *a*, and the  
quarters are united by the back seam, *b*. The  
quarter B is extended to form the flap *b'*, that  
overlaps the instep, and is provided with the  
straps C C' C<sup>2</sup>, which are adapted to engage  
with buckles fastened to the ends of the cor-  
responding straps, *c c' c<sup>2</sup>*. The straps C and *c*  
are widened at their lower ends and overlap  
the side seams, *a*, and are lasted to the sole D  
with the vamp and quarters. The back seam, *b*,  
is protected by the inner stay, E, and the outer,  
stay, F, the inner stay, E, widening at the bot-

tom and being lasted to the sole, and the outer  
stay extending flush with the top of the quar-  
ters in the back and tapering to their front  
ends, as shown, where they are secured to the  
vamp and quarters by the side seams, *a*. This  
outer stay, F, extends from one side seam to  
the other, and is secured at its top edge to the  
quarters by the seam *f*, and is lasted to the sole  
at its bottom edge. The counter G is located  
between the quarters and the stay-piece F.  
The sole D and the heel H are of ordinary con-  
struction, and are lasted to the upper in the  
usual manner. The outer stay, F, and the quar-  
ters are further connected together by the two  
rivets *m*, that are located near the top of the  
quarters, one rivet being arranged on one side  
of the back seam and the other on the other  
side.

Having thus described my invention, what I  
claim, and desire to secure by Letters Patent,  
is—

The herein shown and described shoe, com-  
posed of the vamp and the quarters secured  
together by back and side seams, the end of  
one quarter being extended to form a flap,  
the inner stay, E, the outer stay, F, of one  
piece and extending from one side seam to the  
other, and secured at its ends by the said side  
seams, the upper edge inclining from back to  
front, as shown, and secured to the quarters  
by a row of stitching, and the lower edge being  
lasted in, the straps C C' C<sup>2</sup> and the corre-  
sponding straps, *c c' c<sup>2</sup>*, provided with buckles,  
the straps C and *c* being widened at their lower  
ends to overlap the said side seams and lasted  
in, and the sole and the heel, substantially as  
specified.

In testimony whereof I affix my signature in  
presence of two witnesses.

MARTIN YEAGLE.

Witnesses:

JOSEPH B. KRAMER,  
WM. L. BAKER.
