# UNITED STATES PATENT OFFICE.

HENRY B. WEAVER, OF BURLINGTON, NEW JERSEY.

## INDICATOR FOR BOTTLES.

SPECIFICATION forming part of Letters Patent No. 398,012, dated February 19, 1889.

Application filed August 6, 1887. Serial No. 246,280. (No model.)

*To all whom it may concern:*

Be it known that I, HENRY B. WEAVER, of the city and county of Burlington, and State of New Jersey, have invented a new and useful Improvement in Cork and other Tops or Labels, of which the following is a full, clear, and exact description.

This invention relates to what are known as cork or bottle-stopper tops in common use by druggists and others for various purposes. Usually these tops are simple adhesive-paper or other like labels, with the name, business, and place of business of the vender or other inscribed matter on their faces. They are ordinarily of circular form, and, besides being useful, give a neat finish to the top of the cork when pasted or equivalently secured thereon as a top or cover.

The object of my invention is to enlarge the utility of these tops or labels; and the invention consists in a cork top or label of novel construction, so as to present a dial on its face, with an attached movable index or pointer capable of easily being turned to point to any hour on the dial, for the purpose, among other uses, of indicating when the next dose of medicine contained in the bottle to which the cork having said top belongs should be taken. Such adhesive top or label, however, may not only be applied to the cork of the bottle, but to the side thereof, if desired; likewise to pill, ointment, and other boxes for medicinal or curative purposes.

Reference is to be had to the accompanying drawings, forming a part of this specification, in which similar letters of reference indicate corresponding parts in all the figures.

Figure 1 represents an upper or face view of a cork or other top or label embodying my invention; Fig. 2, an under or back view of the same; Fig. 3, a transverse section thereof, and Fig. 4 a side view of a bottle having my improved dial top or label applied to its cork.

A is the cork top or label, upon the face of which may be printed or inscribed the name, business, and place of business of the putter-up of the medicine or preparation contained in the bottle or package said top or label is applied to, or it may have other printed or written matter on its face, if desired. Usually such inscribed matter will be on the central portion of the top or label marked *b*. Around or outside of this central portion, *b*, is the

dial or dial-surface *c*, divided into numbered hours or other periods of time, and in the center of such dial top or label is a movable index or pointer, *d*, capable of being turned so as to point to any particular hour or division of time, for the purpose hereinbefore named, or other use, as desired.

To the outer portion of the back of the label A is secured the gasket or annulus *e*, having an adhesive substance on the face thereof, so that the said label may be readily fastened where desired. This gasket is of such thickness as to raise or lift the central portion of the label from off the bottle, so that the fastening of the index may not be obstructed or prevented from rotating with it by any mucilage or adhesive substance sticking thereto. In case of the tearing of the gasket when removing the label from the bottle another gasket may be readily secured to the label and thus avoid the furnishing of a new label. Fig. 4 shows this dial top or label applied to the cork B of a bottle, C.

I am aware that it is not new to employ a dial having a pointer thereon in connection with medicine-bottles to indicate the hour or time when the dose is to be taken; but the particular construction herein set forth, wherein an adhesive coating is placed on the outer annular portion of the back of the label, leaving a portion thereof without mucilage or other adhesive substance, so that the inner portion of the fastening device of the pointer or index, and which, as shown, is adapted to rotate with the said index without contact with any of the adhesive substance.

Having thus described my invention, what I claim as new, and desire to secure by Letters Patent, is—

A dial or label for a bottle, consisting of a body portion with dial thereon, and an index or pointer rotatably connected therewith, and a gasket or annulus secured to the outer back portion of said body and having an adhesive substance on its face, the said gasket being of sufficient thickness to permit the rotation of the index-fastener therewith, said parts being combined substantially as described.

HENRY B. WEAVER.
