(No Model.)

H. J. MOYER. KNOCKDOWN SAFE.

No. 465,190.

Patented Dec. 15, 1891.

United States Patent Office.

HENRY J. MOYER, OF FRACKVILLE, PENNSYLVANIA.

KNOCKDOWN SAFE.

SPECIFICATION forming part of Letters Patent No. 465,190, dated December 15,1891.

Application filed February 20, 1891. Serial No. 382,140. (No model.)

To all whom it may concern:

Be it known that I, HENRY J. MOYER, of Frackville, in the county of Schuylkill and State of Pennsylvania, have invented a new 5 and Improved Knockdown Safe, of which the following is a full, clear, and exact description.

My invention relates to improvements in that variety of safes which are used to hold fruits, vegetables, and other food products; 10 and the object of my invention is to provide a convenient, inexpensive, and thoroughlyventilated safe, which may be taken apart or set up very quickly and easily. By having the safe constructed in this manner it may 15 be readily taken apart to be washed, it will occupy but little space, so that it may be cheaply shipped, and a safe of large size may be easily carried into a building and set up in a desired place.

20 To this end my invention consists in a knockdown safe constructed substantially as

hereinafter described and claimed.

Reference is to be had to the accompanying drawings, forming a part of this specification, 25 in which similar letters of reference indicate corresponding parts in all the figures.

Figure 1 is a perspective view of the safe embodying my invention, showing the front, one end, and the top of the same. Fig. 2 is a 30 vertical cross-section on the line 2 2 of Fig. 3; and Fig. 3 is a vertical longitudinal section on the line 3 3 of Fig. 2, a portion being broken away to show the connection between the safe-frame and the top of the safe.

The safe A is constructed with openings through the sides and ends, said openings being covered with screen-cloth, as described hereinafter, so that the safe will be thoroughly ventilated and will also be protected from 40 vermin.

with suitable standards B, which are mounted on legs B', and the end standards are connected at the top and bottom by the cross-45 strips b. The other portions of the safe may be separated from the standards, and the standards may thus be packed together when the safe is taken apart.

On the bottom of the safe and at each end 50 are ledges C, which are fixed to the crossstrips b and which have vertical perforations I the doors G, forming the back, and the doors

c therein, the shelves being adapted to support the safe-bottom D, and ledges C', similar to the ledges C, extend transversely across the end of the safe near the central part, said 55 ledges Chaving similar perforations c therein, and said ledges are adapted to support the central shelf E, and, if desirable, more ledges may be arranged within the safe and other shelves provided. The bottom D consists of 60 two similar portions D', which are provided on the under side with tenons d, which extend downwardly into perforations c of the ledges C, and thus hold the bottom in place. The pieces D', comprising the bottom, are con- 65 nected by hinges d', so that they may easily be folded together, and near the outer edge of each piece is a longitudinal shoulder d^2 to receive the back and front of the safe. The central shelf E comprises two similar pieces 70 E', which are connected by hinges e and are provided with depending tenons e', which extend downwardly in the perforation c of the ledges C', the shelves being supported upon the brackets, as described.

The top F of the safe is composed of two similar pieces F', which are hinged together by the hinges f', each piece F having a longitudinal rib f thereon adapted to shut inside the front and back portions of the safe, so as 80 to make a tight joint and at the same time assist in holding the top in position. The top pieces F' are also provided with depending tenons f^2 , which fit in the sockets b' in the upper cross-pieces b, and the top is thereby 85 held firmly in place. The back of the safe is formed of two vertically-swinging doors G, which are of a size to just form the back of the safe and which are connected centrally by the hinges g.

The front of the safe is composed of two The safe is provided at the four corners | horizontally-swinging doors H, which are of a size to just form the front and which are hinged to the front standards B by the hinges h, the doors being held together by the hook 95 j and eye j', and similar hooks and eyes are applied to the top and the end standards of the safe and to the back and the end standards, so that any of the parts may be removed by simply releasing the hooks from the eyes 100 j'. It will be seen that the ends of the safe,

H, forming the front, are all open in the center, except for the covering K of screen-cloth, which is preferably of wire, and the safe is thus provided with means for ventilation and 5 is also protected against vermin. As shown in the drawings, the screen-cloth K is held in place by the moldings k, although it may be fastened in any suitable manner.

From the foregoing description it will be to seen that the safe may be readily taken apart and that the front, back, bottom, and top, and the central shelf also, may be folded together

so as to occupy but little space.

Having thus fully described my invention, 15 I claim as new and desire to secure by Letters Patent—

1. A knockdown safe comprising two pairs of end standards, each pair being connected, as shown, the upper cross-strips of the stand-20 ards having sockets in their upper face, and the standards having inwardly-projecting ledges with perforations therein, the sectional and folding bottom having depending tenons to fit the perforations of the ledges, a central 25 folding shelf having depending tenons to fit the perforations of the ledges, a sectional and folding top having depending tenons to fit

the sockets of the cross-strips, a back formed

of two vertically-swinging doors, and a front formed of two horizontally-swinging doors, 30 the four sides of the safe having openings therein covered by screen-cloth, substantially as described.

2. A knockdown safe comprising two pairs of end standards, each pair being connected 35 by cross-strips, the upper cross-strip having sockets therein, as shown, and the standards having inwardly-extending ledges with vertical perforations therein, a bottom consisting of two hinged pieces having depending 40 tenons to fit the perforations of the ledges, a central shelf formed of hinged sections and having depending tenons to fit the perforations of the ledges, a top formed of hinged sections and having depending tenons to fit 45 the sockets of the cross-strips, a back formed of vertical folding doors, and a front formed of horizontally-swinging doors, the sides of the safe having screen-covered openings therein and the separable parts being con- 50 nected by hooks and eyes, substantially as described.

HENRY J. MOYER.
