United States Patent Office.

ROBERT FREDERICK FOSTER, OF NEW YORK, N. Y., ASSIGNOR TO CHARLES GOODALL & SON, OF LONDON, ENGLAND.

GAME-MARKER.

SPECIFICATION forming part of Letters Patent No. 478,694, dated July 12, 1892.

Application filed April 8, 1892. Serial No. 428,335. (No model.)

To all whom it may concern:

Be it known that I, ROBERT FREDERICK FOS-TER, gentleman, a subject of the Queen of Great Britain, and a resident of 25 Union 5 Square, New York city, New York, United States of America, have invented a certain new and useful Card-Game Marker, of which the following is a specification, reference being had to the accompanying drawings.

My invention relates to an improved cardgame marker, and is intended to provide a simple apparatus for showing the state of the game both as regards the number of tricks

and the number of points.

In my improved marker the marking-pieces do not project above the level of the base-

piece.

In the accompanying drawings I have shown my invention as applied to a whist-marker, 20 by way of example, though it is to be obmarkers for other card games.

Figure 1 is a plan view of my improved marker, and Fig. 2 is section on the line 2 2,

25 Fig. 1.

A is a wooden base furnished with recesses A', in which marking-blocks B, preferably made of wood, are pivoted on the wire C. A spring D is provided to bear against each 30 block B, so as to keep the same in one or other of two positions. The blocks B have one side B' suitably distinguished from the other adjacent side B2 and from the surface of the base-piece A-as, for instance, the dis-35 tinguishing-face of the block may be light and the other face and the base-piece dark, or vice versa, or the distinguishing-mark may be a numeral. When a trick or point is to be registered, the distinguishing or marking 40 face is turned level with the base, as shown in the right-hand side of Fig. 2. Thus the state of the score is shown at a glance by the marker. In some cases where the faces 45 are provided with numbers the score is indicated by the sum of the numbers that are visible or by the highest number visible.

The great advantage possessed by my improved marker arises from the fact that the 50 marking-blocks never stand up above the l

face of the base-piece, but are always level therewith. They are consequently not liable to be accidentally displaced, and are, moreover, very easily visible from any position at the table. The marking-pieces of some mark- 55 ers in general use when raised are liable to be knocked down accidentally, and, moreover, from certain points of view it is not easily seen how many points are registered. The player may therefore be deceived if he 60 take only a cursory glance thereat. The marking-blocks are capable of being simultaneously turned back by simply pressing their edges on the table.

I make my improved markers of any sort of 65 wood or of ivory, mother-of-pearl, or any other

suitable material.

The markers are preferably used in sets of two for card games, and I prefer to use different woods or materials for the two markers 70 served that it can be equally well applied to | in order to distinguish the same. For example, I may make one with a walnut base and ebony blocks and the other with an ebony base and walnut blocks, the distinguishing or marking sides of the blocks being in both cases 75 faced with ivory.

What I claim is—

1. In a card-game marker, the combination, with a base-piece, of revoluble marking-pieces, each having two indicating-faces, which when 80 indicating are level with the top of the basepiece, substantially as described.

2. In a card-game marker, the combination, with a base-piece, of revoluble marking-pieces, each having two indicating-faces, which when 85 indicating are level with the face of the basepiece, and springs for retaining each said marking-piece in one or other of its two posi-

tions, substantially as described.

3. A card-game marker comprising, in com- 90 bination with each other, the base A, furnished with recesses A', the revoluble blocks the number of distinguishing-faces seen on | B, pivoted in the said recesses, each block having two indicating-faces, one of which is distinguished from the other, and the springs 95 D, adapted to keep the said blocks in one or other of two positions, in both of which the faces of the said blocks are level with the top face of the base, substantially as and for the purpose specified.

100

4. In a card-game marker, the combination of the base A, revoluble blocks B, pivoted in recesses in the same, and the springs D, adapted to keep the said blocks in one or other of two positions, in both of which the faces of the said blocks are level with the top face of the base, substantially as set forth.

In testimony whereof I have hereunto signed my name in the presence of two subscribing witnesses.

ROBERT FREDERICK FOSTER.

Witnesses:

GEORGE HARRISON, A. B. CROFTS.
