(No Model.)

H. E. WERLINE.

ELECTRIC DOUBLE POLE FIXTURE CUT-OUT.

No. 509,500.

Patented Nov. 28, 1893.

United States Patent Office.

HENRY ELMER WERLINE, OF LANCASTER, PENNSYLVANIA, ASSIGNOR OF THREE-FOURTHS TO FRANK S. BARR, OF SAME PLACE, AND EDWIN L. REINHOLD AND HENRY BURD CASSEL, OF MARIETTA, PENNSYLVANIA.

ELECTRIC DOUBLE-POLE FIXTURE CUT-OUT,

SPECIFICATION forming part of Letters Patent No. 509,500, dated November 28, 1893.

Application filed February 15, 1893. Serial No. 462,441. (No model.)

To all whom it may concern:

Be it known that I, Henry Elmer Wer-Line, a citizen of the United States, residing at Lancaster, in the county of Lancaster and 5 State of Pennsylvania, have invented certain Improvements in Electric Double-Pole Fixture Cut-Outs, of which the following is a specification.

This invention relates to improvements in that class of cut-outs by which electric fix-tures are disconnected from the line-wires; and the object of the invention is to provide a safe, convenient and compact cut-out.

This invention consists in forming the cutout of segments separably connected through and longitudinally of the pipe or stem-opening therein.

The invention consists, also, in making the cut-out circular in form, and separable horizontally to detach it from the stem or pipe.

The invention consists, further, in securing the separable parts of the cut-out together by spring-connection.

The invention consists, finally, in fastening the mica or other non-conducting coverings to the cut-out by spring-studs or other resilient connections.

The invention is illustrated in the accompanying drawings, forming a part of this

30 specification, in which-

Figure 1 is a side view of the cut out in its normal position, the fixture canopy being shown in section. Fig. 2 is a bottom plan view of the cut-out. Fig. 3 is a bottom plan view of the branch segment of the cut-out, detached from the other and showing a face view of the contact arms. Fig. 4 is an inner edge view of the main segment. Fig. 5 is a vertical section of the cut out on the line x-x, 40 Fig. 2, viewed from the direction of arrow 1. Fig. 6 is a vertical section on the line y-y, Fig. 3, viewed from the direction of arrow 2. Fig. 7 is a face view of one of the mica plates.

Referring to the details of the drawings, A represents the ceiling; A', the stem or pipe, and A² the fixture canopy. These parts are constructed substantially as those in general use, and, forming no part of the invention, need not be specially described.

The segments B B' are similar in construction tion, and when united constitute a ring having a central stem or pipe opening D, around which is formed a groove b b', separated from said opening by a wall d d' and having an outer or peripheral wall c c'. In the main 55 segment B, the end edges of the section b of groove b b' are beveled, as shown at b^2 , Figs. 4 and 5, for a purpose to be described; and in said groove b there are located two flat spring contact-plates E, having their adja- 60 cent ends e separated by a non-conducting partition F, extending radially across the groove, said ends being secured by bindingscrews G, to which the line-wires L are attached and which pass through openings c^2 65 in the outer wall of the groove. These ends of contact-plates E are firmly and immovably held to their connection with binding-screws G by bolts or screws g. The free or vibrating ends e' of contact-plates E extend to the 70 chord line of the segment and are bent or turned upward above the beveled ends b^2 of section b of groove b b', so as to form a mouth or enlarged opening between the two, as seen at b³, Fig. 4. Inside of this mouth the plates 75 E are dented to form dents or teats t on their under sides, for a purpose to be described.

B' is the branch segment, and has two contact-plates H located in section b' of groove b b' adjacent to each other and separated by 80 a non-conducting partition I. Each contactplate H is fastened in place by a bolt or screw h and is further fastened at one end by a screw J, to which is secured one of the fixture wires K that passes through openings k 85 in the outer wall of the groove. The outer end of each contact plate H is separated from a spring contact-arm M by a rib m and is provided with a screw N from which it is connected with a similar screw N', securing said 90 contact-arm, by a fuse-wire m', passing over one of the ribs m, whereby, upon the occurrence of a "short-circuit" or "ground-on," electrical connection with the wire, lamp or socket beyond the cut-out is destroyed by the 95 fusing of said wire m'. Contact-arms M are also secured by bolts or screws n, which are located between screws N' and the free or

spring-ends M' of said arms, by which means the vibrating movements of the spring-ends are prevented from affecting the connection between the contact arms and screws N'. The 5 extremities of ends M' are pointed or beveled, as shown at n', Fig. 5, to facilitate their insertion in mouths b^3 , and each of said ends has a hole l through it adapted to be engaged by one of the teats t. When the cut-out is 10 attached to the stem or pipe the segments are engaged about it from opposite sides, the spring ends being inserted in mouths b^3 and the segments closed upon each other until their edges meet, as shown in Fig. 2, when 15 teats t are in engagement with holes l, the junction of those parts being maintained by the resiliency of the ends of contact-plates E and the ends M'. But as teats t are spherical in outline, the segments BB' can readily 20 be separated by pulling them in opposite directions. It will thus be seen how easy it is to engage the cut-out with the pipe or stem, and close the circuit, or disengage the segment containing the fuse-wires from the seg-25 ment carrying the line-wires and thus open the circuit and render the fuse-segment safe to handle in renewing the fuses and adjusting the insulating covers.

To prevent the charged parts from coming 30 in contact with the person or the escape of sparks or molten fuse-wire attendant upon the forming of a "short-circuit" or "groundon," the parts in groove bb' are covered by mica or other non-conducting plates, P P', 35 resting in the groove and conforming in length with that of the arcs of the segment. Each plate P P' is removably secured in place by a spring-stud, the stem, S, of which passes through a perforation, T, in one of the par-40 titions F I and through a recess, p, made in the periphery of said plate. The head t'of the stud laps over the edges of recess pand binds them down on the face of the partition by reason of the action of a spring R, 45 coiled about stem S and having one end bearing against a shoulder r in one end of perforation T and the other against a thumb-button V, formed on the opposite end of stem S. To release one of these plates, thumb-button 50 V is pressed inward so as to push head t'away from partition F or I and then recess p is disengaged from stem S by raising the plate and drawing it inward. In replacing the plate, the operation is reversed. This 55 construction affords a very simple and efficient means for removably securing the plates. Heretofore, these mica plates have been attached by screws, requiring the employment of a screw-driver in detaching and 6c replacing them.

Throughout, the construction of this cutout is simple and convenient. Being annular in outline it occupies the least possible
amount of space, and as it is divided into segments separably connected it is readily put in
place or detached from the stem or pipe, while
the connection of the segments by interlock-

ing spring-arms held in engagement by their own resiliency alone makes the attaching and detaching of the parts very simple and easy. 70

Having thus described my invention, what I claim as new, and desire to secure by Letters

Patent, is—

1. An electric-fixture cut-out divided through and longitudinally of the pipe or 75 stem-opening thereof into segments separably connected by electrical conductors, substantially as and for the purpose specified.

2. An electric-fixture cut-out divided through and longitudinally of the pipe or 80 stem-opening thereof into segments, one of said segments being provided with contact-plates and the other with spring-contact-arms, the said contact-arms engaging the contact-plates and holding the segments separably 85 together, substantially as and for the purpose specified.

3. An annular electric fixture cut-out divided into segments, one of said segments being provided with contact-plates and the 90 other with spring-contact-arms, the said contact arms engaging the contact-plates and separably uniting the segments, substantially

as and for the purpose specified.

4. In an electric fixture cut-out divided into 95 segments, the combination, with a segment provided with contact-plates, of a grooved segment and spring-contact-arms located in said groove and engaging the contact-plates and separably uniting the segments, substantially 10 as and for the purpose specified.

5. In an electric fixture cut-out divided into segments, the combination, with a segment provided with contact-plates having upturned ends, of a segment having spring-contact-arms, 10 said contact-arms engaging with the contact-plates beneath the same and separably uniting the segments, substantially as and for the pur-

pose specified.

6. In an electric fixture cut-out divided into 11 segments, the combination, with a segment provided with contact-plates and having its contacting-edge beveled beneath the contact-plates, of a segment having spring-contact-arms, said contact-arms engaging with the 11 contact-plates beneath the same and separably uniting the segments, substantially as and for the purpose specified.

7. In an electric fixture cut-out divided into segments, the combination, with a segment 12 provided with contact-plates having upturned ends and having its contact-edge beveled beneath the contact-plates, of a segment having spring-contact-arms, said contact arms engaging with and beneath the contact-plates and 12 separably uniting the segments, substantially as and for the purpose specified.

8. In an electric fixture cut-out, divided into segments, the combination, with a segment provided with contact plates having indentations or teats formed therein, of a segment having perforated spring-contact-arms, said contact arms engaging the contact-plates with the perforations therein registering with the

509,500

indentations or teats of the contact-plates, substantially as and for the purpose specified.

9. In an electric fixture cut-out divided into segments, the combination, with a segment provided with contact-plates having upturned ends and indentations or teats formed therein, the said segment having its contacting edge beveled beneath the contact-plates, of a segment having perforated spring-contact-arms, said contact-arms engaging beneath the contact-plates with the perforations therein registering with the indentations or teats of the contact-plates, substantially as and for the purpose specified.

15 10. In an electric-fixture cut-out divided through and longitudinally of the pipe or stem opening thereof into segments, the combination, with a segment provided with spring-contact plates, of a segment having spring-contact-arms, the said contact-arms engaging said contact-plates and separably uniting the segments, substantially as and for the

purpose specified.

11. In an electric fixture cut-out divided into segments having registering grooves, the combination, with a segment provided with spring-contact-plates, of a segment having spring-contact-arms, said plates and arms being located in the grooves, the contact-arms engaging said contact-plates and separably uniting the segments, substantially as and for the purpose specified.

12. The combination with an electric fixture cut-out divided into segments, one of said segments being grooved, of contact-plates located in said groove, ribs separating the contact-plates, and fuse-wires passing over said ribs and connecting the contact-plates, substantially as and for the purpose specified.

13. The combination, with an electric fixture cut-out divided into segments, of a segment provided with contact-plates, a segment
having spring-contact arms, said contact-arms
engaging with said contact-plates and separably uniting the segments, contact-plates located between the contact-arms and separated
therefrom by ribs, and fuse-wires passing over
the ribs and connecting the contact-arms with
the contact-plates located between them, substantially as and for the purpose specified.

14. The combination, with an electric fixture cut-out divided into segments, of a segment provided with contact-plates, a grooved segment having spring-contact arms, said 55 contact arms engaging with said contactplates and separably uniting the segments, contact-plates placed between the contactarms and separated therefrom by ribs, the contact-arms and the contact plates placed

between them being located in said groove, 60 fuse-wires passing over the ribs and connecting the contact arms and the contact-plates placed between them, and a non-conducting plate covering the contents of the groove, substantially as and for the purpose specified. 65

15. The combination, with an electric fixture cut-out divided into segments having grooves registering with each other, of a segment provided with contact-plates, a segment having spring contact-arms, said contact-arms 70 engaging with said contact-plates and separably uniting the segments, contact-plates placed between the contact-arms and separated therefrom by ribs, the contact-arms and contact plates being located in the grooves, 75 fuse wires passing over the ribs and connecting the contact-arms and the contact-plates placed between them, and non-conducting plates covering the grooves, substantially as and for the purpose specified.

16. In an electric fixture cut-out divided into segments, the combination, with the conducting and connecting parts thereof, of non-conducting plates covering said parts secured to each segment, and spring-stude removably 85 connecting said plates with the segments, substantially as and for the purpose specified.

17. The combination with an electric-fix-ture cut-out divided into segments, of a segment provided with contact-plates, a grooved 90 segment having contact-arms placed in the groove and engaging said contact-plates, contact-plates located in the groove between the contact-arms and connected therewith by fuse-wires passing over interposed ribs, and 95 a non-conducting plate covering the groove and removably connected with the segment by a spring-stud, substantially as and for the purpose specified.

18. The combination, with an electric fixture cut-out divided into segments having
grooves registering with each other, of a segment provided with contact-plates, a segment
having contact-arms engaging said contactplates, contact-plates placed between the contact-arms and connected therewith by fusewires passing over interposed ribs, said contact-arms and contact-plates being located in
the grooves of the segments, and non-conducting plates covering the grooves and removably connected with the segments by
spring-studs, substantially as and for the purpose specified.

HENRY ELMER WERLINE.
