UNITED STATES PATENT OFFICE.

WILLIAM T. JEFFERSON, OF NEW YORK, N. Y.

PAPER BUILDING-BLOCK.

SPECIFICATION forming part of Letters Patent No. 550,793, dated December 3, 1895.

Application filed May 22, 1895. Serial No. 550,194. (No model.)

To all whom it may concern:

Be it known that I, WILLIAM T. JEFFERSON, a citizen of the United States, residing in the city, county, and State of New York, have invented certain new and useful Improvements in Paper Building-Blocks, of which the following is a specification.

This invention relates to an improved toy building-block which can be readily separated and folded or collapsed so as to be conveniently shipped and rapidly made up whenever required, and forms a very cheap and attractive toy building-block for children's use, which can also be used to advantage for advertising purposes; and the invention consists of a toy building-block which is composed of two sections, of which the inner section is of slightly less size than the outer section, so that it can be slipped into the same and sustain and reinforce the outer section, the outer faces of said sections being provided with letters of the alphabet, numbers, and other characters, and the sections of said block being creased at the corners and adapted to be folded up and collapsed when the sections are detached from each other.

In the accompanying drawings, Figure 1 represents a perspective view of my improved toy building-block. Figs. 2 and 3 are perspective views of the two sections of the same, shown as separated from each other. Fig. 4 is a vertical transverse section on line 4 4, Fig. 1; and Fig. 5 is a side elevation of the sections of the block, shown in their flattened or collapsed condition.

Similar letters of reference indicate corresponding parts.

Referring to the drawings, A and B represent, respectively, the outer and inner box-like sections of my improved toy building-block. Each section is made of stout paper or other suitable stiff material, which is printed on its outside with letters, numbers, and other characters, the sections A B, from which the block is made, being respectively transversely creased at four points *a a a a* and *b b b b*, so as to rapidly form the corners

of the block when it is set up. Each box-like section is open at the ends, and the inner section B is to be smaller than the section A, so that the former can be readily inserted into the outer section in such a manner that the axis passing through the center of the open ends of one section is at right angles to the axis passing through the center of the open ends of the outer section. When the inner box-like section B is inserted into the outer box-like section A, a closed cubical block that has considerable strength is formed, as the inner section reinforces the outer section, as shown in Figs. 1 and 4. Some of the sides or panels of the box-like sections may be used for advertising purposes, so that toy building-blocks can be furnished at a comparatively small expense.

When shipping the blocks the sections are disconnected from each other and flattened or collapsed, as shown in Fig. 5, in which state any quantity of blocks can be shipped in a small space. The blocks are rapidly made up for use and form very attractive and educational blocks for children's use.

Having thus described my invention, I claim as new and desire to secure by Letters Patent—

A foldable or collapsible toy building-block, composed of an outer box-like section open at opposite sides an inner box-like section of somewhat smaller size inserted in the outer section, said section being also open at opposite sides, but the inner section being inserted in such a manner that its open sides are at right angles to the open sides of the outer section, and said sections being creased at their corners so as to be folded into flat or collapsed shape when detached, substantially as set forth.

In testimony that I claim the foregoing as my invention I have signed my name in presence of two subscribing witnesses.

WILLIAM T. JEFFERSON.
