## G. H. TAYLOR. DRESS PROTECTOR.

No. 560,241.

Patented May 19, 1896.

## United States Patent Office.

GEORGE H. TAYLOR, OF NEW YORK, N. Y.

## DRESS-PROTECTOR.

SPECIFICATION forming part of Letters Patent No. 560,241, dated May 19, 1896.

Application filed March 24, 1896. Serial No. 584,647. (No model.)

To all whom it may concern:

Be it known that I, George H. Taylor, a resident of the city, county, and State of New York, have invented certain new and useful Improvements in Dress-Protectors, of which the following is a specification.

My invention relates to dress-protectors of the character in which a cord is employed within the bight of the velveteen or other 10 material of which the dress-protector is made. This cord is of such extent in cross-section as to form an enlarged bead at the lower edge of the protector to prevent the lower edge of the skirt, which is secured above the 15 bead, from becoming abraded. Heretofore in dress-protectors of this character it has been customary to place the velveteen or other material of which the dress-protector is made in direct contact with the cord in the 20 bight. This would result in the material sinking into the interstices formed between the strands in the cord and giving a corrugated appearance to the bead on the exterior of the protector.

The object of my invention is to overcome these and other defects found in dress-protectors heretefore made

tectors heretofore made.

To this end my invention consists in the novel arrangement and combination of parts

30 hereinafter described and claimed.

In the accompanying drawings, wherein like letters indicate corresponding parts in the various views, Figure 1 is an inside face view of a portion of a dress-protector made in accordance with my invention. Fig. 2 is an outside face view of the same. Fig. 3 is a vertical section on line 3 3 of Fig. 1. Fig. 4 is a face view of a portion of another form of dress-protector made in accordance with my invention. Fig. 5 is a vertical section on line 5 5 of Fig. 4.

In the accompanying drawings, A represents an outer fabric, which may be made of any suitable material, such as velveteen, and is preferably cut upon the straight and corrugated at an angle to the length thereof, as indicated at a, so that the necessary elasticity had in a textile fabric cut upon the bias is provided. A second fabric of buckoram is provided, as indicated at B, which buckram fabric is cut upon the bias, as indicated in Fig. 2. The two fabrics are doubled

to form a bight b, in which is contained a cord C. This cord C is secured in the bight of the doubled fabrics, as by a line of stitch- 55 ing c, which preferably passes through the cord and prevents longitudinal movement thereof in the bight of the fabric.

The dress-protector may be formed of an outer fabric A, covering one side thereof, as 60 indicated in Figs. 1, 2, and 3, or may extend to the entire depth of the dress-protector on both sides, as indicated in Figs. 4 and 5. These fabrics A and B may be secured at the upper edge in any suitable manner, as 65

by a line of stitching d.

By my invention I am enabled to provide a dress-protector wherein the fabric may be cut upon the straight, thereby avoiding considerable waste inherent in protectors which 70 are cut upon the bias and at the same time provide a protector which is cheap, efficient, and neat in appearance, the buckram in the fabric maintaining the outer fabric in a smooth condition and at the same time giv-75 ing more body and stiffness to the article as a whole.

I am aware that it is old to employ buckram as a stiffening for the bottom of skirts and do not claim, broadly, the use of such 80 buckram or the employment of buckram in combination with other textile fabrics; but

What I do claim, and desire to secure by

Letters Patent, is—

1. A dress-protector comprising an outer 85 fabric, an inner fabric of buckram cut on the bias, said inner and outer fabrics being doubled to form the bight and a cord contained within said bight and secured therein to form a bead upon one edge of the dress- 90 protector.

2. A dress-protector comprising an outer fabric, an inner fabric of buckram cut on the bias, said inner and outer fabrics being doubled to form a bight and extending 95 throughout the entire depth of the dress-protector, a cord contained within said bight and secured therein to form a bead upon one edge of the dress-protector.

GEORGE H. TAYLOR.
