# UNITED STATES PATENT OFFICE.

GEORGE F. BARRETT, OF WILKES-BARRÉ, PENNSYLVANIA.

## NON-REFILLABLE BOTTLE.

SPECIFICATION forming part of Letters Patent No. 591,724, dated October 12, 1897.

Application filed December 19, 1896. Serial No. 616,261. (No model.)

*To all whom it may concern:*

Be it known that I, GEORGE F. BARRETT, a citizen of the United States, residing at Wilkes-Barré, in the county of Luzerne and State of Pennsylvania, have invented certain new and useful Improvements in Non-Refillable Bottles; and I do declare the following to be a full, clear, and exact description of the invention, such as will enable others skilled in the art to which it appertains to make and use the same.

My invention has relation to improvements in non-refillable bottles; and the object is to provide a bottle of this class that will indicate that access has been had to the bottle after it has been originally filled; and to this end the novelty consists in the construction, combination, and arrangement of the same, as will be hereinafter more fully described, and particularly pointed out in the claim.

In the accompanying drawings the same reference-numerals indicate the same parts of the invention.

Figure 1 is a perspective view of a bottle embodying my invention, and Fig. 2 is a vertical section of the same.

1 represents the neck of the bottle, and 2 2 two vertical circular orifices open at the top and communicating with the mouth 3 by means of the lateral curved channels 4 4.

The bottle is filled in the usual manner and the cork or stopple 6 inserted so that its lower edge extends below the channels 4 4. After the cork is inserted, as above described, the orifices 2 2 are filled through their tops with an innocuous liquid, the cork preventing said liquid from running out. The tops of the

orifices 2 2 are then sealed with melted glass and the operation is complete. When the cork is drawn, the liquid in the orifices 2 2 runs through the channels 4 4 into the bottle, and the fact that the cork has been drawn is apparent at a glance. In practice I prefer to fill the orifices with different-colored liquids, which are also different in color from the contents of the bottle.

Although I have specifically described the construction and relative arrangement of the several elements of my invention, I do not desire to be confined to the same, as such changes or modifications may be made as clearly fall within the scope of my invention without departing from the spirit thereof.

Having thus fully described my invention, what I claim as new and useful, and desire to secure by Letters Patent of the United States, is—

A non-refillable bottle, comprising the cylindrical neck 1, having its mouth terminating in a horizontal plane flange and the walls of the neck formed with vertical parallel orifices 2 2, the lower ends 4 4, of which come inwardly and communicate with the passage in the neck, in combination with the removable cork 6, adapted to close the lower ends 4 4 of said vertical parallel orifices 2 2, the upper ends of which are then sealed with melted glass, substantially as shown and described.

In testimony whereof I hereunto affix my signature in presence of two witnesses.

GEORGE F. BARRETT.
