UNITED STATES PATENT OFFICE.

RUDOLPH HENRY PFEIFFER AND WILLIAM FRED. HAHN, OF PENSACOLA,
FLORIDA.

COMBINATION DOMINO BOX AND MARKER.

SPECIFICATION forming part of Letters Patent No. 627,875, dated June 27, 1899.

Application filed June 16, 1897. Serial No. 641,048. (No model.)

To all whom it may concern:

Be it known that we, RUDOLPH HENRY PFEIFFER and WILLIAM FREDRICH HAHN, citizens of the United States, residing in Pensacola, county of Escambia, State of Florida, have invented a new and useful Domino Box and Marker Combined, the box and counters being detachable, each forming a separate part, of which the following is a specification.

Figure 1 in the accompanying drawings shows a perspective view of the box when put together. Fig. 2 shows a similar view of the box, being partly open. Fig. 3 shows a perspective view of the marker when detached.

The three parts forming the box are held together when not in use by the hooks *a* and *b*, as shown in Figs. 1 and 2 of the accompanying drawings.

The top and bottom forming the markers are laid off in squares, the squares being numbered from five to two hundred and fifty, respectively. Each square also has a hole for a peg to be inserted and used in counting when playing. Should the first count be five, the first peg will be inserted in the first hole bearing the first count five. Should the next count be fifteen, the player will take the second peg and count from the first hole—thus, five, ten, fifteen—and insert his second peg in the corresponding hole. His correct account will thus be always before him where he puts his last peg.

We are aware that prior to our invention

game-counters have been invented. We therefore do not claim our invention broadly; but

What we do claim as our invention, and desire to secure by Letters Patent, is—

1. In combination with a rectangular frame, a base-board having apertures on its upper surface provided with numbers, a lid having numbered apertures on its under side, hooks pivoted to the frame and engaging pins on the edges of the base and lid, substantially as described.

2. In combination, a rectangular frame, having pins protruding from the upper and lower edges, a base having apertures to receive the pins, a lid having apertures to receive the upper pins, double hooks pivoted to the sides of the frame and engaging pins protruding from the edges of the lid and base, substantially as described.

3. In combination with a frame having pins extending from the upper and lower edges, a lid and base having apertures for the pins, numbered holes on the upper surface of the base and the lower surface of the lid and means for clamping the base-frame and lid together, substantially as described.

RUDOLPH HENRY PFEIFFER.
WILLIAM FRED. HAHN.
