UNITED STATES PATENT OFFICE.

HATTIE C. CROPLEY, OF WASHINGTON, DISTRICT OF COLUMBIA.

HOT-WATER BAG.

SPECIFICATION forming part of Letters Patent No. 647,294, dated April 10, 1900.

Application filed January 23, 1900. Serial No. 2,468. (No model.)

To all whom it may concern:

Be it known that I, HATTIE C. CROPLEY, a citizen of the United States, and a resident of Washington, District of Columbia, have invented certain new and useful Improvements in Convertible Hot-Water Warming Appliances, of which the following is a specification, reference being had therein to the accompanying drawings, in which—

10 Figure 1 is a plan view. Fig. 2 is a transverse sectional view on line 2 2 of Fig. 1. Fig. 3 is a transverse sectional view through the filling-apertures, showing only the main bag or receptacle inflated. Fig. 4 is a longitudinal sectional view showing the main bag inflated, the supplemental bag being deflated and lying close against the main bag. Fig. 15 5 is a longitudinal sectional view showing both bags inflated and a foot in the foot-warming pocket, and Fig. 6 is a detail view of a modified form of closure device.

The object of the invention is to provide a device adapted for use as an ordinary hot-water bag, and which in addition may be 25 formed into a foot-warmer by inflating a supplemental bag to form a pocket surrounded by hot water, into which pocket the forward parts of the feet may be placed.

The invention consists in the combination 30 and arrangement of parts hereinafter described, and particularly pointed out in the claims appended.

Referring to the various parts by numerals, 1 designates a main water-bag, which 35 is shown substantially flat and may be of any desired size and is constructed of any suitable thin waterproof flexible material. This bag is provided at its forward end with a filling-opening 2, which is provided with a removable closure device 3. Secured to the 40 upper side of this main water-bag, at the forward end thereof, is a small and flat supplemental water-bag 4, which is also formed of thin flexible material and is provided with an independent filling-opening 5, closed by a removable closure device 6. This supplemental 45 bag is about half the length of the main bag; but it is equal thereto in width and is cemented or otherwise suitably secured at its outer marginal edge 7 to the corresponding 50 outer edge of the main bag and when deflated lies close against the upper surface of the said

main bag. The rear transverse edge 8 of this supplemental bag is unconnected to the main bag and forms, with the main bag, the mouth 55 of a pocket 9, which is closed except along the edge 8 and is adapted to receive the forward parts of the feet when the device is used as a foot-warmer. Secured between the bags at the rear corners of the supplemental bag 60 are the ends of the heel-strap 10, which when the device is used as a foot-warmer engages the feet of the user above the heels, as indicated in Fig. 5, and holds the device in position. This strap or securing device may be 65 of any suitable material and of any desired form. It may be a loop, as shown in Figs. 1 and 5, or it may be two strings or tapes, as indicated in dotted lines in Fig. 1, and it may be elastic or non-elastic, as is found desirable. 70

In the main views the filling-passages 2 and 5 are shown as formed by dividing a tube 11 by a central wall 13. In this way the two passages are contiguous and a single filling cup or funnel 14 may be employed. This is 75 advantageous in that the receptacles may be simultaneously filled.

In Fig. 6 is shown a single closure device, which closes the filling-openings of both bags and also prevents the contents of either bag 80 from flowing into the other bag. This single closure device may be used instead of the two independent devices shown in Figs. 3, 4, and 5. In this construction the stopper 15 is threaded into the mouth of the filling-tube 85 and bears on the end of the wall 13 and closes both filling-passages.

It is desirable that communication between the two bags be prevented in order that the device may be successfully adapted to the 90 double use for which it is designed.

It will be readily seen that when the two bags are inflated a very convenient and effective foot-warmer is provided which will receive both feet, the forward parts thereof being 95 entirely enveloped in the pocket formed by the two bags and the heel parts resting on that part of the main bag which extends beyond the rear end of the supplemental bag. When it is desired to use the device as an ordinary hot-water bag, the main bag only is 100 inflated, as shown in Fig. 4, the supplemental bag remaining deflated and lying close against the upper surface of the main bag out of the

way. It is desirable that the supplemental bag terminate short of the rear end of the main bag in order that the heels of the user may rest on the main bag and be warmed.

- 5 In this way practically the entire foot will be immediately warmed without the necessity of employing an expensively - made foot-warmer of shoe or boot shape. The upper surface of the main bag and the inner surface
10 of the supplemental bag may be suitably covered, if desired.

Having thus fully described my invention, what I claim, and desire to secure by Letters Patent, is—

- 15 1. In a hot-water appliance, the combination of a flexible main water-receptacle formed with a filling-opening, a flexible supplemental water-receptacle secured to the upper side of the main receptacle and forming therewith a
20 pocket for the feet, said supplemental receptacle being also formed with a filling-opening, means for closing said filling-openings and preventing communication between the two receptacles.

- 25 2. A hot-water appliance comprising a main water-receptacle, a supplemental water-receptacle connected to one side of the main receptacle at one end thereof and also at its side edges and being of less length than the
30 main receptacle, a pocket being thereby formed between the two receptacles, the mouth of said pocket being transverse of the main receptacle, and removable means for retaining water in said receptacles.

- 35 3. In a hot-water convertible appliance, the combination of a main water-receptacle, a supplemental water-receptacle secured to one

side of the main receptacle and of less length than the main receptacle, a pocket being formed between said receptacles, the mouth
40 of said pocket being transverse to the main receptacle, said receptacles being formed with filling - openings, and removable closure means for closing said filling-openings and preventing communication between the two
45 receptacles.

4. In a hot-water convertible appliance, the combination of a main receptacle provided with a filling-opening, a supplemental receptacle secured to one side of the main recep-
50 tacle and forming therewith a pocket whose mouth is transverse to the main receptacle, said supplemental receptacle being provided with a filling-opening, an independent removable device for closing each of the said filling-
55 openings, and means for securing the device to the feet.

5. In a hot-water convertible appliance, the combination of two flexible receptacles se-
60 cured together, a foot-warming pocket being formed between them, an independent filling passage or tube for each receptacle, said passages lying side by side, a single filling-cup surrounding the outer ends of said passages
65 or tubes, whereby the receptacles may be simultaneously filled, and removable means for closing said filling-passages.

In testimony whereof I hereunto affix my signature, in the presence of two witnesses, this 19th day of January, 1900.

HATTIE C. CROPLEY.
