UNITED STATES PATENT OFFICE.

ROBERT B. ELLIOTT, OF HAMLETSBURG, ILLINOIS.

FENDER FOR CULTIVATORS.

SPECIFICATION forming part of Letters Patent No. 655,068, dated July 31, 1900.

Application filed August 11, 1899. Serial No. 726,954. (No model.)

To all whom it may concern:

Be it known that I, ROBERT BARNES ELLIOTT, a citizen of the United States, residing at Hamletsburg, in the county of Pope and State of Illinois, have invented a certain new and useful Improvement in Fenders for Cultivators; and I do declare the following to be a full, clear, and exact description of the invention; such as will enable others skilled in the art to which it appertains to make and use the same.

My invention relates to improvements in clod-fenders, and more particularly to that class adapted to be used in connection with cultivators.

The object of this invention is to provide a fender which can be easily and quickly applied, one that is simple in its construction, and will efficiently perform all of its intended functions.

With this object in view and such others as may hereinafter appear my invention consists in the particular construction of the various parts and in the novel manner of combination and arrangement of said parts, all of which will be fully described, and specifically pointed out in the appended claim.

In the drawings forming a part of this specification, Figure 1 is a perspective view showing the fender as applied. Fig. 2 is a side elevation.

Referring by letters to the drawings, A represents the body of the fender, which consists

of a metal plate having the forward end curved, as shown at B, so as to pass over any obstruction which the fender may come in contact with; and its lower edge curved inward, as shown at C, in order to prevent the clogs from forcing the fender up, thereby permitting them to slip thereunder. The plate is slotted, so as to form bars D, which are adapted to pulverize the ground turned over by the cultivation and to prevent the clogs from being thrown against the plants.

While I have shown in the accompanying drawings the fender attached to a cultivator by rods, I do not confine myself to the exact construction, as it is obvious that the fender may be attached in various ways without departing from the spirit or sacrificing any of the advantages of this invention.

Having thus described the various features of my invention, what I claim as new, and desire to secure by Letters Patent, is—

In a clod-fender, a metal plate having a series of vertical slots therein, the forward end of the plate curved up, and its lower edge curved inward, substantially as shown and described.

In testimony whereof I affix my signature in the presence of two witnesses.

R. B. ELLIOTT.
