UNITED STATES PATENT OFFICE.

HARRY A. MCINTOSH, OF LIBERTY, INDIANA.

INHALER.

SPECIFICATION forming part of Letters Patent No. 659,542, dated October 9, 1900.

Application filed February 14, 1900. Serial No. 5,206. (No model.)

To all whom it may concern:

Be it known that I, HARRY A. MCINTOSH, a resident of Liberty, in the county of Union and State of Indiana, have invented certain
5 new and useful Improvements in Inhalers; and I do hereby declare the following to be a full, clear, and exact description of the invention, such as will enable others skilled in the art to which it appertains to make and use
10 the same.

My invention relates to an improvement in inhalers, the object of the invention being to provide an inhaler which can be used for either the mouth or nose and which will in
15 appearance resemble a cigar-holder.

With this object in view the invention consists in certain novel features of construction and combinations and arrangements of parts, as will be more fully hereinafter described,
20 and pointed out in the claims.

In the accompanying drawings, Figure 1 is a view in section, illustrating my improvements in position for use as a nasal inhaler; and Fig. 2 is a similar view of the device when
25 in position for use as an inhaler for the mouth or in position for conveniently carrying the device in a pocket.

A represents a cylindrical casing contracted at one end to form a mouthpiece 1 and
30 provided in its other end with a tubular plug 2, closed at its inner end by a disk 3, for closing the end of said casing and adapted to give to the device the appearance of a cigar-holder.

35 The casing A is provided in its upper side, near the mouthpiece end, with a hole 4, in which a nasal tube 5 is mounted. The lower end of said tube 5 is made flaring, as shown at 6, so that when said tube is drawn outward
40 the flaring lower end of said tube will fit snugly in the hole 4 and hold the tube in its raised or outer position. The outer or upper end of the tube 5 is provided with an enlargement 7, and the casing A is made with a recess around the hole 4 to form a seat and partial housing for the enlargement to practically hide the same from view when not in use, and said enlargement 7 is provided in
45 one side with a small notch 9, in which the finger-nail of the operator can be easily inserted to effect the withdrawal of the tube 5 when desired.
50

An air-tube 10 extends from the mouthpiece to a point near the plugged end of the casing, and a medicated sponge or other similar device is placed in the casing, near the
55 plugged end thereof, and preferably surrounds the tube 10.

The operation of my improvements when used as a nasal inhaler is as follows: The
60 tube 5 is inserted in the nose and the mouthpiece 1 in the mouth of the patient, and when he exhales or blows into the mouthpiece his breath will be forced through the medicated sponge and convey the medicated vapor
65 through the tube 5 into the nose and thence into the lungs. If desired, the nasal tube 5 can be pushed inward into the casing and the medicated vapor inhaled through the
70 mouth, for when the patient inhales through the mouthpiece air will be drawn through the nasal tube 4, thence through the medicated sponge into the air-tube 10 and through the same to the mouth. The plug 2 can be readily removed when it is desired to recharge the
75 sponge or to clean the casing, and the device when assembled will be extremely small and convenient to carry, and owing to its resemblance to a cigar-holder will not excite curiosity, as is the case with all devices of similar character now on the market.
80

Various slight changes might be resorted to in the general form and arrangement of the several parts described without departing from the spirit and scope of my invention,
85 and hence I would have it understood that I do not wish to limit myself to the precise details set forth, but consider myself at liberty to make such slight changes and alterations as fairly fall within the spirit and scope of
90 my invention.

Having fully described my invention, what I claim as new, and desire to secure by Letters Patent, is—

1. An inhaler comprising a casing having
95 a mouthpiece at one end, absorbent material in said casing, means for introducing air to one side of said absorbent material and a tube sliding freely in the wall of the casing and normally inclosed therein.
100

2. An inhaler comprising a tubular casing having a mouthpiece at one end and a removable plug at its other end, a tube communicating with the mouthpiece and termi-

3
nating near the plugged end of said casing,
a nasal tube communicating with said casing
and a medicated absorbent disposed in said
casing between the first-mentioned tube and
5 nasal tube.

3. An inhaler comprising a casing contract-
ed at one end to form a mouthpiece and closed
at its other end and having a hole in its wall,
a nasal tube loosely mounted in said hole and
10 an enlargement at each end of said tube to
prevent its displacement.

4. An inhaler comprising a casing having
an opening therein, a tube loosely mounted
in said opening and made flaring at its inner

end to snugly fit in the opening when the tube 15
is pulled outward, an enlargement on the
outer end of said tube to prevent its entrance
into the casing when pushed inward, said cas-
ing recessed to form a seat for said enlarge-
ment. 20

In testimony whereof I have signed this
specification in the presence of two subscrib-
ing witnesses.

HARRY A. MCINTOSH.
