## N. M. POWELL. BOOT OR SHOE CLEANER.

(Application filed Nov. 9, 1900.)

(No Model.)

Hilnesses F. C. Alden. Fig. I

## United States Patent Office.

NOAH MONROE POWELL, OF QUINCY, ILLINOIS, ASSIGNOR OF ONE-HALF TO WILLIAM H. GOVERT, OF SAME PLACE.

## BOOT OR SHOE CLEANER.

SPECIFICATION forming part of Letters Patent No. 671,169, dated April 2, 1901.

Application filed November 9, 1900. Serial No. 35,976. (No model.)

To all whom it may concern:

Be it known that I, NOAH MONROE POWELL, a citizen of the United States, residing at Quincy, in the county of Adams and State of. 5 Illinois, have invented a new and useful Boot or Shoe Cleaner, of which the following is a specification.

This invention relates to boot and shoe cleaners; and the object of the same is to proro vide simple and effective means for removing mud and other material from a boot or shoe by moving the limb on which the latter is fitted or applied between opposing cleaning devices with a kicking action, the said 15 means being strong and durable and easily set up in operative position.

The invention consists in the construction and arrangement of the several parts, which will be more fully hereinafter described and

20 claimed.

In the drawings, Figure 1 is a perspective view of the improved cleaner. Fig. 2 is a transverse vertical section through the same. Fig. 3 is a detail perspective view of one of 25 the resilient supporting devices.

Similar numerals of reference are employed to indicate corresponding parts in the several

views.

The numeral 1 designates a base or bed, of 30 any suitable form and material, that will be securely held in fixed position, or the said base or bed may be a portion of a step or porch-floor to which the remaining devices composing the cleaner may be secured.

The cleaner embodies two oppositely-disposed brushes 2, having the bristles turned inwardly toward each other and held in elevated position by resilient wire frames comprising substantially U-shaped horizontal members 40 3, with the legs intermediately bent and upturned vertically to provide supports 4, having terminal eyes 5. The said frames when applied have the horizontal portion of one leg of each arranged inside the similar leg por-45 tion of the other and in close relation, the said horizontal leg portions being secured by staples or analogous devices, and as both frames are pushed into each other as far as possible the complete support for the brushes

will be solidly and strongly braced to render 50 it durable to withstand the strain brought to bear thereon during the operation of the brushes. By the arrangement of the frames as set forth one support 4 of each frame rises vertically on each side, and the pair of sup- 55 ports on opposite sides have their terminal eyes 5 secured to the backs of the brushes 2. By this means the brushes are maintained in proper spaced relation, and the interspace between the inner terminals of the bristles is 60 always preserved in accordance with the initial arrangement, and when the boot or shoe is thrust between the said bristles the supports yield sufficiently to permit the full entrance of the boot or shoe, but exert an in- 65 ward pressure strong enough to effectively carry on the cleaning function of the said brushes during the kicking action imparted to the boot or shoe, and thereby thoroughly remove the mud or other accumulations on 70 the latter. By the arrangement of the frames as set forth a further advantage is gained in distributing the strain equally over both of the same, and a very light, durable, and cheap supporting means for the brushes can be used 75 and of a nature which will afford means for readily removing the deposits from the brushes that may collect within the confines thereof.

The brushes may be of any preferred type, 80 and those already found in the market for

cleansing purposes are preferred.

The parts may be suitably ornamented, and changes in the form, size, proportions, and minor details may be resorted to without de- 85 parting from the principle of the invention.

Having thus described the invention, what

is claimed as new is—

1. In a boot or shoe cleaner, the combination with a base-rest, of wire frames having 90 pairs of upstanding supports on opposite sides, the one support of each pair being a part of a different frame, and brushes having the terminals of said supports secured thereto.

2. In a boot or shoe cleaner, the combina- 95 tion with a base-rest, of a pair of wire frames having horizontal portions and legs intermediately bent to provide upstanding supports,

the frames being fitted into each other to have the horizontal portion of the leg of one inside the similar portion of the other to have a pair of said supports on each side and the one support of each pair being a part of a different frame, and brushes to which the upper terminals of said supports are secured.

In testimony that I claim the foregoing as my own I have hereto affixed my signature in the presence of two witnesses.

NOAH MONROE POWELL.

Witnesses:
JOSEPH N. CARTER,
N. S. PROCTOR.
