S. A. McKELVEY. GAME APPARATUS.

APPLICATION FILED OCT. 29, 1902.

NO MODEL

United States Patent Office.

SAMUEL A. McKELVEY, OF PITTSBURG, PENNSYLVANIA.

GAME APPARATUS.

SPECIFICATION forming part of Letters Patent No. 724,920, dated April 7, 1903.

Application filed October 29, 1902. Serial No. 129,283. (No model.)

To all whom it may concern:

Be it known that I, SAMUEL A. MCKELVEY, a citizen of the United States of America, residing at Pittsburg, in the county of Allegen and State of Pennsylvania, have invented certain new and useful Improvements in Game Apparatus, of which the following is a specification, reference being had therein to the accompanying drawings.

This invention relates to certain new and useful improvements in games, and more particularly to a game board or apparatus whereby interesting and instructive games may be

played.

01

Briefly described, my invention comprises a somewhat rectangular table or bed having a wall around the edge and provided adjacent the front edge with a series of pockets or inclosures. At the back of the table or 20 bed is arranged a substantially rectangular casing, in which is mounted a series of bells or like alarms, the front of the casing being provided with a series of openings, which may be graduated or made of different size 25 for the purpose, as will more presently appear. The casing carries a pair of hinged shields, which project outwardly at an incline to the front face of the casing when the device or apparatus is set up in position to 30 be used. The casing is constructed at the lower side of its target-face with a slot, whereby the balls or other objects projected at the target may roll out of the casing onto the casing or bed into one or more of the pockets or 35 inclosures, all of which construction will be hereinafter more fully described, and specifically pointed out in the claims.

In describing the invention in detail reference is had to the accompanying drawings, forming a part of this specification, and where in like numerals of reference indicate like parts throughout the several views, in which—

Figure 1 is a detail perspective view of my improved game apparatus. Fig. 2 is a detached detail perspective view of the inclosure-strip for the bottom of the target-casing. Fig. 3 is a transverse vertical sectional view, and Fig. 4 is a like view through the propelling device for the ball or other object.

o To put my invention into practice, I provide the somewhat rectangular table or bed

1, provided at its ends and along the front edge with a wall 2, this wall also extending along a portion of the rear edge of the table and joining with the ends of the substantially 55 rectangular casing 3. The front 4 of this casing 3 forms a target, and to this end it is provided with a series of openings 5, which may be of different sizes, as shown, and each of these openings may be designated by a nu- 60 meral of different value, the larger openings preferably having numerals of smaller value and the smallest opening having a number of larger value than any of the others.

To the inner face of the rear wall of the 65 casing 3 is secured a series of gongs 6, a gong being placed behind each of the apertures 5, and in the bottom of the casing is an inclined wall 7, whereby the spherical objects after they enter the casing 3 will roll out through 70 the slot or opening 8, provided therefor at the bottom of the target, and onto the table or bed. I preferably arrange upon the bed or table 1 a series of inclosures which are numbered different values, a practical form 75 of inclosure being a strip 9 and having a Tshaped head 10. Thus the projecting ends of the T-shaped head form ways 11, through which the spherical objects must roll into the inclosures. The casing is closed at its top by 80 a cover 12, having the upwardly-extending front 14, which projects above the target and gives a greater surface thereto, a suitable brace 15 being provided for this upwardlyprojecting strip 14. The casing carries a pair 85 of hinged shields 16, the lower edges of which rest upon the table or head 1, and when the device is disassembled these shields 16 may be closed down over the front of the target 4. In case it is not desired to have the spherical 90 objects roll out onto the table or bed 1, I may close the slot or opening 8 by the strip 17, which carries the feet 18 to rest upon the table or bed.

The game is played by having a suitable 95 propelling device to project the objects at the target, the object of the game being to shoot the spherical object into a certain one of the openings 5, so that the same will strike the gong and sound the same. In Fig. 4 I have 100 shown a practical form of propelling device in the form of a small cannon comprising a

barrel 19, having a spring-actuated plunger 20, which extends through the rear of the barrel and is propelled forward by the spring 21, which is arranged in the recess in the rear of 5 the barrel, the spring having its forward end passed through the propelling-plunger 20. This gun is suitably mounted so as to be sighted to different elevations. The casing 3 is placed at the rear of the table or bed 1, ro with hinged shields opened out in the manner shown in Fig. 1. The propelling device is placed at a suitable distance in front of the target and the operators endeavor to propel the ball or other object placed in the can-15 non through the desired one of the openings 5. If the ball passes through the opening, it will strike the gong or bell and give the _alarm. In event it fails to pass through one of the openings it will be retained on the 20 table or bed 1 and counts for whatever amount is given to the inclosure into which the ball finally rolls, providing it rolls into one of the inclosures. The game is played by two or more, a certain predetermined number win-25 ning the game—for instance, one hundred and the first person to make one hundred will win the game. The count will be made according to the value placed upon the openings 5 through which the ball passes and 30 also the value of the inclosure on the table or bed into which the ball may roll.

Other forms of propelling devices than herein shown may be employed, and it will also be observed that various changes may be made in the details of construction without departing from the general spirit of my in-

vention.

Having fully described my invention, what

I claim as new, and desire to secure by Letters Patent, is—

1. In a game apparatus, the combination with a bed or table having an inclosing wall and provided along the forward edge with a series of inclosures, of a substantially rectangular casing, the front of which forms the 45 target and is provided with a series of openings, gongs mounted in the casing back of each opening, the said shields hinged to the casing and resting on the table or bed, substantially as described.

2. In a game apparatus, the combination with a table or bed having a series of inclosures along the front edge, of a substantially rectangular casing at the rear of the table or bed provided in its front with a series of openings of different sizes, a bell or gong mounted in the casing back of each opening, and hinged shields carried by the casing and resting on the bed or table at each end of the target, substantially as described. 60

3. In a game apparatus, a table or bed having an inclosing wall, the casing at the rear end of the table or bed, the front face of which forms the target and is provided with a series of openings, gongs mounted in the 65 casing back of each opening, an inclined bottom in the casing below the gongs, the said shields carried by the casing projecting outwardly at an incline from each end of the target, substantially as described.

In testimony whereof I affix my signature

in the presence of two witnesses.

SAMUEL A. MCKELVEY.

Witnesses:

JOHN N. DUNN, E. E. POTTER.
