O. R. HUNT.

LEAF SUPPORT FOR ARTICLES OF FURNITURE.

APPLICATION FILED SEPT. 17, 1902. RENEWED JUNE 1, 1908.

THE NORRIS PETERS CO., PHOTO-LITHO., WASHINGTON, O. C.

UNITED STATES PATENT OFFICE.

OZELLO R. HUNT, OF KENOSHA, WISCONSIN, ASSIGNOR TO THE SIMMONS MANUFACTURING COMPANY, OF KENOSHA, WISCONSIN, A CORPORA-TION OF WISCONSIN.

LEAF-SUPPORT FOR ARTICLES OF FURNITURE

SPECIFICATION forming part of Letters Patent No. 733,046, dated July 7, 1903.

Application filed September 17, 1902. Renewed June 1, 1903. Serial No. 159,628. (No model.)

To all whom it may concern:

Be it known that I, OZELLO R. HUNT, a citizen of the United States, residing at Kenosha, in the county of Kenosha and State of Wis-5 consin, have invented a new and useful Improvement in Leaf-Supports for Articles of Furniture, of which the following is a specification.

My invention relates particularly to auto-10 matically-released supports for the folding leaves of convertible articles of furniture, such as couches and sofa-beds.

My primary object is to provide an automatically-disengaged support for a leaf movrs able from a horizontal position, as when the article of furniture is used as a bed, to a veris used as a couch.

The invention is illustrated in the accom-

20 panying drawings, in which

Figure 1 represents a broken view, in end elevation, of a couch equipped with my improvement; Fig. 2, a broken sectional view looking at the inner side of the end frame 25 shown in Fig. 1, and Figs. 3 and 4 broken inner perspective views illustrating the manner in which the leaf-supports are automatically disengaged to allow the leaf to be lowered.

The invention is here shown applied to the front leaf of a sofa-bed of the type employing a vertical standing rear leaf or back (not shown) and a vertical depending front leaf.

The preferred construction is as follows: A 35 represents the swinging front leaf of a convertible couch or sofa-bed; A', the main frame of said article of furniture; A2, a leaf-supporting link connected by a pivot A3 with the leaf A; A⁴, a link-releasing cam carried by | tions a^5 will pass beneath the projections a^2 , 40 the main frame, and B a wire fabric of any suitable construction applied to the frame and leaf. The main frame has end standards (one shown) comprising front vertical members (angle-irons) A5, having rearwardly-45 turned flanges A⁶ and inturned flanges A⁷. The flanges A7 are connected by an angle-iron A⁸, having a downturned flange and a rearwardly-turned flange. The ends of this member fit within the angles of the vertical mem-50 bers A5, and the horizontal flange supports

the cams A4, (one at each end.) Each cam A4 comprises a base portion a, a substantially vertical portion a', and an outturned upper portion a^2 . The portion a^2 terminates in an oblique edge a³, which extends rearwardly 55 and outwardly. The links A2 lie in planes parallel with the end standards and extend through slots a^4 in the flanges A^7 . Each link terminates at its free end in an inturned cam portion a⁵, having an oblique inclined edge 60 a^6 crossing the edge a^3 , assuming the leaf to be in the extended position. Adjacent to its extremity the link is provided on its lower edge with a notch a^7 , presenting a shoulder a⁸, which serves to engage the flange A⁷ at 65 the lower wall of the slot a^4 in the extended tical depending position, as when said article | position of the leaf, and a surface a^9 , which serves to raise the link when the leaf is raised somewhat above a horizontal to effect a release.

The manner in which a release is effected will be understood readily from Figs. 3 and 4. When the leaf is raised somewhat above the horizontal position that is indicated in dotted lines in Figs. 1 and 2, the lower ends 75 of the links are caused to rise, as stated, and in their movement the cam-surfaces as engage the cam-surfaces as and cause the upper portions of the members A4 to spring inwardly till the portions a^5 clear the portions 80 a², whereupon the members A⁴ resume their original positions and the portions a⁵ ride upon the upper surfaces of the portions a^2 , so that the shoulders a are held out of engagement with the stationary shoulders at 85 the lower walls of the slots a^4 as the leaf is lowered. Of course it will be understood that when the leaf is again raised the projecso that the links can drop to the locking po- 90 sition when the notches a reach the proper position.

Changes in details of construction within the spirit of the appended claims may be made. Hence no undue limitation should be 95 understood from the foregoing detailed description.

What I regard as new, and desire to secure by Letters Patent, is—

1. In an article of the character described, 100

the combination with a main frame provided with a shoulder, and a swinging leaf connected with said frame, of a link connected with said leaf and provided with a shoulder serv-5 ing to lockingly engage said first-named shoulder and provided also with a cam, and a yielding resilient cam on the main frame opposed to said first-named cam and over which the latter rides during the release, for

10 the purpose set forth.

2. In an article of the character described, the combination with a main frame provided with a stationary shoulder, and a swinging leaf connected with said frame, of a link con-15 nected at one end with said leaf and provided near its opposite end with a shoulder serving to lockingly engage said first-named shoulder and provided also with a lateral projection, and a yielding cam on the main frame op-20 posed to said projection and over which the latter rides during the release, for the pur-

pose set forth.

3. In an article of the character described, the combination with a main frame provided 25 with a stationary shoulder, and a swinging leaf connected with said frame, of a link connected at one end with said leaf and provided near its opposite end with a shoulder serving to lockingly engage said first-named shoulder 30 and provided also with a lateral projection, and a yielding resilient cam fixed to the main frame and opposed to said projection and which is forced aside when the leaf is raised above the horizontal and over which said pro-35 jection rides when the leaf is lowered to effect a release.

4. In an article of the character described, the combination with a main frame provided with a guide and a stationary shoulder, and

a swinging leaf connected with said frame, 40 of a link connected with said leaf and provided with a shoulder serving to lockingly engage said first-named shoulder and provided with a laterally-projecting cam, and a spring-metal cam fixed to the main frame and 45 having a lateral projection engaging said first-named projecting cam, for the purpose

set forth.

5. In an article of the character described, the combination with a main frame compris- o ing end standards and a member connecting said end standards, and a swinging leaf connected with said main frame, of links connected with said leaf and having their free ends extending through suitable guides on 55 said frame, said links having inturned projections, and yielding resilient cams carried by the member connecting said end standards and having outturned projections, for the

purpose set forth. 6. In an article of the character described, the combination with a main frame comprising end standards and a member connecting said end standards, and a swinging leaf connected with said main frame, of links con- 65 nected with said leaf and having their free ends extending through suitable guides on said frame, said links having inturned projections provided with oblique edges, and yielding resilient cams carried by the mem- 70 ber connecting said end standards and having outturned projections provided with oblique edges engaging said first-named oblique edges, for the purpose set forth.

OZELLO R. HUNT.

In presence of— A. C. KITTLESON, ALBERT D. BACCI.
