## UNITED STATES PATENT OFFICE.

CARL A. ROSELAND, OF ROCKFORD, ILLINOIS.

## TOASTER.

SPECIFICATION forming part of Letters Patent No. 741,720, dated October 20, 1903.

Application filed January 30, 1903. Serial No. 141,175. (No model.)

*To all whom it may concern:*

Be it known that I, CARL A. ROSELAND, a citizen of the United States, residing at Rockford, in the county of Winnebago and State of Illinois, have invented certain new and useful Improvements in Toasters, of which the following is a specification.

The object of this invention is to construct a toaster in which a series of flues are located over the base-plate, through which air circulates and upon which the article to be toasted is placed.

In the accompanying drawings, Figure 1 is an isometrical representation of my improved toaster. Fig. 2 is a section of one of the flues. Fig. 3 is a section showing the means for holding the flues in position.

The base-plate 1 is made from sheet material, having the side edges 2 turned over on the base-plate. The ends are each formed of the vertical bends 3, horizontal bends 4, and return vertical bends 5. The vertical bends 3 are provided with triangular openings 6. Flues 7 of V shape are located over the base-plate, the open side next the plate, and the ends passing through the triangular openings 6 in the vertical bends and resting against the return-bends. A bail 8 has a pivotal con-

nection with one edge of the base-plate and has sections 9 formed at an angle to the main portion in order that the main portion will be held free of the stove when in use.

By the employment of the flues an air-space is formed through which air circulates, thereby keeping the flues cooler than the base-plate, and as the articles to be toasted rest upon the flues they will not burn, but a nice brown crisp will be imparted to them.

I claim as my invention—

1. A toaster comprising a solid base-plate and a series of independent flues located with their open face in contact with the base-plate and held against lengthwise movement.

2. A toaster comprising a base-plate two sides of which are formed with two vertical and one horizontal sections, one of the vertical sections of each side formed with openings, and a series of independent flues located over the base-plate and in the openings, and held against displacement by the other vertical section of each side.

CARL A. ROSELAND.
