United States Patent Office.

JOSEPH F. RIEDY, OF HAMBURG, IOWA.

DISPLAY-STAND.

SPECIFICATION forming part of Letters Patent No. 778,335, dated December 27, 1904.

Application filed June 9, 1904. Serial No. 211,814.

To all whom it may concern:

Be it known that I, Joseph F. Riedy, a citizen of the United States, residing at Hamburg, in the county of Fremont and State of Iowa, have invented certain new and useful Improvements in Display-Stands; and I do declare the following to be a full, clear, and exact description of the invention, such as will enable others skilled in the art to which it appertains to make and use the same.

My invention relates to stands for displaying couches or similar articles of furniture in

stores, salesrooms, and the like.

The object of my invention is to provide a simple, durable, and comparatively inexpensive display-stand by means of which couches of various kinds and sizes may be pivotally supported, so that they may be swung to any desired position to permit any part of them to be readily inspected.

With this and other objects in view the invention consists in certain novel features of construction, combination, and arrangement of parts, as will be more fully described, and particularly pointed out in the appended

claims.

In the accompanying drawings, Figure 1 is a side elevation of my improved display-stand, showing a couch mounted thereon. Fig. 2 is a vertical transverse sectional view taken on the line 2 2 of Fig. 1. Fig. 3 is a horizontal sectional view taken on the line 3 3 of Fig. 1. Fig. 4 is a detail view illustrating the elongated eyes of the cross-braces and the manner of connecting said braces to the uprights.

Referring to the drawings by numeral, 1 denotes my improved display-stand, which comprises a suitable base 2 and a pair of uprights 3, projecting vertically from said base. Said base 40 may be of any suitable form; but as illustrated it comprises two parallel side rails 4, which are spaced apart and secured together by a pair of crossed diagonal braces 5. The ends of said braces may be secured to the rails in any suitable manner; but I preferably form them with elongated eyes or openings 6, through which and openings formed in said rails are passed bolts or other similar fastening means 7. The uprights 3 project vertiseally and have their lower ends secured to the

centers of the side rails 4 by bolts or other suitable fastening means 8. The uprights are also secured to the rails by pairs of angularly-disposed braces 9, which have their upper ends secured to the uprights 3 by rivets 10 and 55 their lower ends formed with openings through

which the bolts 7 also project.

The upper ends of the uprights 3 are formed with openings 11, through which screws 12 are passed to pivotally secure a couch 13 or 60 any other suitable article of furniture desired to be displayed upon them. As shown, the upper ends of the uprights lie against the inner faces of the sides of the couch, and the screws 12 are screwed into said sides; but any 65 other suitable means may be provided for securing the couch upon the uprights. In order to accommodate the stand to couches of different widths or sizes, I may adjust the uprights toward and from each other by means 7° of a pair of cross-braces 14. Said braces are pivoted intermediate their ends by a rivet or the like 15 and have their lower ends bent at right angles and formed with openings through which the said screws or bolts 8 also pass to se-75 cure them to the lower ends of the uprights. The upper ends of the braces 14 are also bent at right angles and are formed with openings through which the bolt 16 is passed to secure them to the upper portions of the uprights. 80 The bolts 16 may be passed through any one of a vertical series of openings 17, formed in the uprights at or near their centers, in order to permit the upper end of the braces to be adjusted vertically upon said uprights. It will 85 be seen that when the bolts 16 are removed and the upper ends of the braces 14 are adjusted vertically upon uprights the latter will be drawn toward or from each other, so that the distance between them will correspond to 90 the width of the couch or other piece of furniture. Owing to the sliding connection of the braces 5 and 9 with the rails 4, any lateral movement of the uprights 3 when they are adjusted will be compensated for.

It will be understood that couches to be supported upon the display-stand may be of varying widths and the uprights 3 may be adjusted at different distances apart to conform to the width of the couch to be supported by 100

means of the braces 14, which may be either spread farther apart at their upper ends or brought closer together, and thus carrying the uprights inward or outward at their upper ends to conform to the width of the couch. The elongated eyes 6 in the cross-braces 5 permit the movement referred to.

From the foregoing description, taken in connection with the accompanying drawings, the construction and operation of the invention will be readily understood without re-

quiring a more extended explanation.

Various changes in the form, proportion, and the minor details of construction may be resorted to without departing from the principle or sacrificing any of the advantages of this invention.

Having thus fully described my invention, what I claim as new, and desire to secure by

20 Letters Patent, is--

1. A display-stand of the character described, comprising a suitable base, uprights projecting from said base, and means for pivotally supporting a couch or the like upon the upper ends of said uprights, substantially as described.

2. A display-stand of the character described, comprising a suitable base, uprights projecting from said base, means for supportions of said uprights, and means for adjusting said uprights toward and from each other to accommodate couches of different sizes, substantially as described.

3. A display-stand of the character de-

scribed, comprising a suitable base, laterally-adjustable uprights upon said base, and means for pivotally mounting a couch or the like between said uprights, substantially as described.

4. A display-stand of the character described, comprising a suitable base, uprights mounted upon said base, means for mounting a couch or the like upon said uprights, and a pair of pivotally-connected cross-braces adapted to adjust the latter laterally, substantially as

described.

5. A display-stand of the character described, comprising a pair of side rails, a pair 50 of cross-braces adjustably connected to said side rails to secure them together, uprights secured to said side rails, braces connecting said side rails and said uprights, pivots upon the upper ends of said uprights adapted to 55 pivotally secure a couch thereon, and a pair of pivotally-connected cross-braces having their lower ends secured to the lower ends of said uprights and their upper ends adjustably secured to the upper portions of said uprights, 60 whereby said uprights may be adjusted laterally to accommodate couches of different sizes, substantially as described.

In testimony whereof I have hereunto set my hand in presence of two subscribing wit- 65

nesses.
