G. F. TAIT.

CURTAIN POLE BRACKET.

APPLICATION FILED NOV. 27, 1905.

UNITED STATES PATENT OFFICE.

GEORGE F. TAIT, OF MCDONALD, PENNSYLVANIA.

CURTAIN-POLE BRACKET.

No. 827,272.

Specification of Letters Patent. Patented July 31, 1906.

Application filed November 27, 1905. Serial No. 289,172;

To all whom it may concern:

Be it known that I, GEORGE F. TAIT, a citiald, in the county of Washington and State 5 of Pennsylvania, have invented certain new and useful Improvements in Curtain-Pole Brackets; and I do declare the following to be a full, clear, and exact description of the invention, such as will enable others skilled in to the art to which it appertains to make and use the same, reference being had to the accompanying drawings, and to the figures of reference marked thereon, which form a part of this specification.

This invention relates to an improved curtain-pole bracket; and it comprises a means whereby the bracket may be extended beyond and attached to the top portion of the window-frame, a means for attaching the 20 curtain-pole thereto, together with the certain details of construction and combination of parts, as will be fully described hereinaf-

ter.

In the accompanying drawings, Figure 1 is 25 a front elevation of one of the brackets having one end of a curtain-pole supported therein, said bracket being provided with my improved means for attaching the same to the window-frame. Fig. 2 is an end sectional 30 elevation of the same, said section being taken on the line X X of Fig. 1. Fig. 3 is a plan view of the bracket removed from the window-frame. Fig. 4 is a detailed perspective view of the eccentric and its connected 35 strap used in connection with the curtaintastener.

To put my invention into practice, I first provide a bracket comprising a body portion 3, an integral part 4, forming the bracket 40 proper, a horizontal integral flanged member 10, adapted to rest upon the top of the window-frame 20, said member being formed with slots 11 extending in the direction of its length, by means of which screw-eyes 19 45 may be used to firmly attach the bracket to the window-frame. This flanged member 10 and the body portion 3 of the bracket is formed with perforations through which nails or screws 11' are passed, which arrange-50 ment affords another means of attaching the bracket to the window-frame or to a flat surface, as will be best seen by reference to Figs. 2 and 3 of the drawings. The top or horizontal member of the bracket is provided 55 with a slot 3', which extends downward a short distance into the part 4, forming the !

brace, and serves to support the forward end of a bar 8, the rear end of which is connected zen of the United States, residing at McDon- | by a thumb-screw 9 in such manner that the said bar may be moved in or out and clamped 60 at any desired position. The forward end of this bar 8 is formed into a semicircular loop 6, the inner extremity of which projects upward above the said bar and is fitted with a set-screw 7, the said loop being adapted to 6! receive one end of the curtain-pole 1 and be clamped therein by means of the screw 7. By this construction of a bracket the curtainpole 1 may be adjusted toward or away from the window-frame 20 a limited distance, and 70 by means of the horizontal disposed member 10 the bracket may be extended beyond the end of the said frame, as will be seen by reference to Fig. 1 of the drawings.

To disengage the bracket from the window- 75 frame when the same is attached in position by means of the screw-eyes 19, it is only necessary to turn said eyes to a position in line with the slots 11, at which time the bracket may be lifted free. The screws 11' are used 80 only when attaching the bracket to a flat surface and are dispensed with when attachment is made with the window-frame. Two of these brackets, as above described, are used, the one at either end of the window- 85 frame to give proper support to the curtainpole arranged in the loops 6, as is obvious.

The curtain-pole shown in the drawings comprises a cylindrical rod 1 of a suitable length and diameter, having ornamental end 90 pieces and the said pole formed with a groove 2 extending its entire length. At points near each end of the pole 1 and at either side of the groove 2 are arranged two eyelets 15, the one located opposite to the other, and in 95 which is hinged a link 16, the upper portion of which is fitted with an eccentric cam 17, having an integral lever 18, said cam being adapted to engage with one end of a bar 12 used to confine the curtain to the pole 1. This roo bar 12 comprises a thin strip of wood or other material of a length almost equal to that of the pole 1 and is provided at each end with one or more saw kerfs or slots 13 to break the rigidity of the bar at those points. This bar 105 12 is formed at the ends with reduced portions 14 to operate in connection with the cams 17, which hold said bar in position.

To attach the curtain to this style of pole, it is only necessary to place the same over 110 the top, and when said curtain has been adjusted to the proper position the bar is partly

inserted in the slot 2, forcing the curtain therein. The ends of the bar 12 are attached to the pole by passing the links 16 over the same and the said bar pressed tightly in position by revolving the cam 17 to the position shown in dotted lines at Fig. 1 of the drawings.

The advantages of a bracket for curtainpoles constructed as set forth are obvious,
and various slight modifications and changes
may be made in the same without departing
from the spirit of the invention. Therefore
I do not wish to confine myself to the exact
constructions shown and described, but wish
to claim all such modified forms as would
come properly within the general scope of
the invention.

Having thus described my invention, what I claim, and desire to secure by Letters Pat-

20 ent, is—

1. The herein-described curtain-pole bracket comprising the bracket proper and means for attaching the curtain-pole thereto, a horizontally-disposed member arranged at

right angles to raid bracket, said member being slotted for the reception of screw-eyes and provided with an angular perforated flange along its length, whereby the bracket may be attached to either a vertical or horizontal surface.

2. The herein-described curtain-pole bracket comprising the bracket proper and means for attaching the curtain-pole thereto, a horizontally-disposed member arranged at right angles to said bracket, said member being slotted for the reception of screw-eyes and provided with an angular perforated flange along its length, in combination with a sliding bar 8, provided with a semicircular loop 6, the upper inner end of which is fitted with a set-screw and a means for attaching said bar rigid with the bracket.

In testimony whereof I affix my signature

in presence of two witnesses.

GEORGE F. TAIT
