UNITED STATES PATENT OFFICE.

SAMUEL A. DENNIS, OF LOS ANGELES, CALIFORNIA.

FAUCET.

No. 829,695.

Specification of Letters Patent.

Patented Aug. 29, 1906.

Application filed June 16, 1905. Serial No. 265, 562.

To all whom it may concern:

Be it known that I, SAMUEL A. DENNIS, a citizen of the United States, residing at Los Angeles, in the county of Los Angeles, State 5 of California, have invented certain new and useful Improvements in Faucets; and I do hereby declare the following to be a full, clear, and exact description of the invention, such as will enable others skilled in the art 10 to which it appertains to make and use the same.

This invention relates to faucets.

One object of the invention is to provide an exceedingly simple, inexpensive, durable, 15 and efficient faucet for use in connection with basins, tubs, sinks, or other main waterpipe lines.

Another object of the invention is to provide a faucet for use upon cans or other pack-20 ages for containing liquids in transit, the structure being such that the faucet may be quickly applied to and removed from the short tubular spout through which the ordi-

ary oil-can is usually filled.

With these and other objects in view the present invention consists in the combination and arrangement of parts, as will be hereinafter more fully described, shown in the accompanying drawings, and particuc 30 larly pointed out in the appended claim, it being understood that changes in the form, proportion, size, and minor details may be made, within the scope of the appended claim without departing from the spirit or sacrific-35 ing any of the advantages of the present invention.

In the drawing there is shown a vertical sectional view of the present invention.

Referring now more particularly to the ac-40 companying drawing, the reference character 1 designates the outer end of a feed-water pipe, which is screw-threaded, as at 2, for engagement therewith of a cap 3, having its flange 4 interiorly screw-threaded for engage-45 ment with the screw-threads 2 of the feedwater pipe. This cap 3 is provided with a central inner cavity 5 and an internal circumscribing flange 6 whose inner face is parallel with the inner face of the cavity or 50 recess 5. The flange 6 circumscribes in a plane corresponding to the plane of the circumscribing flange 4, but is spaced therefrom and projects beyond the inner face of the cap to a greater extent than the circum-55 scribing flange 4.

the corresponding face of the inner flange 6 is screw-threaded for the reception of the exteriorly-screw-threaded end 7 of the casing 8, which is provided with oppositely-disposed 60 openings 9, by which communication is established between the casing 8 and the tubular member 10, which latter has its inner end screw-threaded for engagement with the screw-threads of the interior face of the in- 65 termediate enlarged portion 11 of the casing 8. By reason of the screw-threaded engagement of the tubular member 10 with the interior of the casing 8 the edge 12 of the said tubular member may be screwed to the inner 70 end 13 of the casing 8 into engagement with the washer 14 to prevent the ingress of water from the feed-pipe to the valve-casing and the tubular member 10. It will be observed. that by reason of the increased internal 75 thickness 11 of the valve-casing 8 there is an annular space formed between the upper and lower ends of the casing and the tubular member 10 to reduce friction when the tubular member is turned for opening and closing 80 the valve.

The tubular member 10 is provided with a hand gripping member 15, which may be formed therewith or separately therefrom, as may be desired. It will be understood that 85 this tub ular member 10 is the discharge-pipe of the faucet and that when it is screwed inwardly, so that its lower edge 12 will engage the washer 14, the water cannot enter from the feed-pipe 1 into the openings 9 for pas- 90 sage through the nozzle. It will therefore be understood that when the nozzle is turned to the position just described the valve is closed, and it will be readily appreciated that in order to open the valve it is only necessary 95 to turn the latter in such direction as to separate the edge 12 thereof from the washer 14 to permit of the ingress of water from the feed-pipe to the nozzle by the way of the aforesaid openings 9.

In order to prevent detachment of the nozzle from the valve-casing, I secure a pin or other suitable projection 16 to the outer face of the lower end thereof, which will engage the shoulder 17, formed by the increased thick- 105. ness 11, absolutely preventing accidental dis-

100

110

engagement of the nozzle.

The washer 14, hereinbefore referred to, may be of rubber or any other suitable material and is preferably flat.

From the foregoing it will be seen that my The inner face of the cavity or recess 5 and | invention is of an exceedingly simple inex-

pensive nature and that leakage between the different elements is absolutely prevented. Another feature to be appreciated is that the device may readily be assembled and that the 5 separation of the parts thereof cannot be accomplished accidentally.

What is claimed is—

- ja

The combination with a pipe having its outer end exteriorly screw-threaded, of a cap 10 arranged for detachable screw-threaded engagement with the said outer end of the pipe, said cap having a passage therethrough and a circumscribing flange surrounding the passage, a valve-casing engaged with said cir-15 cumscribing flange and provided with open-

ings at its lower end, a removable valve-seat arranged upon the bottom of said valve-casing, and a nozzle passed through the passage in said cap and into the casing for longitudinal movement within the latter to move the 20 lower edge of the nozzle toward and away from said valve-seat to close and establish communication between the pipe and the nozzle.

In testimony whereof I affix my signature 25 in presence of two witnesses.
SAMUEL A. DENNIS.
