M. F. LUNA.

MATCH BOX.

APPLICATION FILED JAN. 11, 1907.

## UNITED STATES PATENT OFFICE.

MANUEL F. LUNA, OF SALTILLO, MEXICO.

## MATCH-BOX.

No. 872,243.

Specification of Letters Patent.

Patented Nov. 26, 1907.

Application filed January 11, 1907. Serial No. 351,856.

To all whom it may concern:

Be it known that I, MANUEL F. Luna, a citizen of Mexico, and a resident of Saltillo, Coahuilla, Mexico, have invented certain new and useful Improvements in Match-Boxes, of which the following is a specification.

My invention is an improvement in match boxes, and consists in certain novel constructions and combinations of parts as will be hereinafter described and claimed.

In the drawings Figure 1 is a pespective view of a match box embodying my invention. Fig. 2 is a vertical longitudinal sec-15 tion thereof on about line 2—2 of Fig. 1. Fig. 3 is a cross-section on about line 3—3 of Fig. 1. Fig. 4 is a detail perspective view of a holder removed from the case. Fig. 5 is a detail perspective view showing said holder 20 opened out. Fig. 6 is a detail perspective view showing a modified form of match box in which the casing is hinged at one side to open. Figs. 7, 8 and 9 illustrate different forms of corrugated material, Fig. 10 illus-25 trates a modified form of button for sliding the holder. Fig. 11 shows the corrugated material of the match channels formed of sand paper to provide an abrading surface.

In carrying out my invention I construct 30 the box with a case A and with a holder B of a length less than the case A. This holder B in the construction shown in Figs. 1, 2 and 3, is slidable within the case A, the ends of the case being open so that the holder can be 35 slid back and forth to expose one or the other end of the holder at one or the other open end of the case. To facilitate this sliding movement of the holder, the case is slotted longitudinally at A', and the holder B is pro-40 vided with a button B' projecting into the slot and forming a handle by which the holder may be slid back and forth within the case. The holder is provided with individual longitudinally disposed pockets or chan-45 nels B<sup>2</sup> for the matches C. These channels communicate at their inner ends with cross channels B<sup>3</sup> preferably separated by an in-

C lying in the cross grooves, as shown in the drawings. The longitudinal channels B<sup>2</sup> are preferably formed by corrugated sheet material, it may be paper or other suitable substance, and a retaining plate B<sup>5</sup> covering the open sides of the corrugations and retaining

tervening rib B4, the heads C' of the matches

55 the matches therein. This covering plate is preferably of sand paper to form an abrad-

ing surface against which the matches will rub as they are drawn longitudinally out of their channels, but the sand paper or abrading surface may be applied on the corru- 60 gated material if desired, as shown in Fig. 11.

In the construction shown in Figs. 1, 2 and 3, the holder has two rows of match channels opening at each end, and the matches when disposed therein with their heads in the 65 cross channels and their other ends projecting from the longitudinal channels will be inclosed within the casing when the holder is at a central point between the ends of the casing. Now by sliding the holder to one 70 or the other end of the casing the match ends will be exposed, and the matches may be individually drawn out of the holder from their respective channels ignited.

As constructed, the match box is adapted 75 to be carried in the pocket and can be conveniently operated whenever desired.

In Fig. 6, I show a somewhat different construction of casing in which the latter is formed of two sections D and D', flexibly 80 united at one edge D<sup>2</sup> so they may be opened, the match holders E constructed with longitudinal and cross channels, and a corrugated material as before described are secured to the sections midway between the ends 85 thereof so the outer ends of the matches will be inclosed within the case and yet will be convenient of access when the case is opened. By this construction also it will be noticed that I employ small single rows of 90 channels at the opposite ends of the holder.

Manifestly the match holder may be made of paste-board, wood, metal or other suitable material.

It will be understood that the matches 95 may be supplied to the holders when the latter are opened, as shown in Fig. 5, and the holders can be subsequently closed and applied to the casing.

Any suitable form of matches, such as 100 wax, wood, paste-board or the like may be employed.

The outer side of the cases may receive advertisements either of the maker of the matches or others, as may be desired.

I claim—

1. A match box comprising a casing open at both ends, and a match holder of a length less than the length of the casing and slidable longitudinally therein between the opposite 110 open ends of the casing, the casing having a longitudinal slot and the holder having a

button projecting thereinto and forming a handle by which the holder may be moved within the casing, said holder being provided with longitudinal channels opening at its opposite ends and within which individual matches may be placed and moved longitudinally and with cross channels at the inner ends of said longitudinal channels for reception of the heads of the matches and with a rib or partition extending between the cross channels, substantially as and for the pur-

channels, substantially as and for the purpose set forth.

2. A match box, comprising a casing open at both ends and a holder movable longitu15 dinally within the casing and of a length less than that of the casing and provided at its opposite ends with longitudinal channels for matches, and with a cross channel between the inner adjacent ends of said longitudinal channels substantially as set forth.

3. A match box comprising a casing open at both ends, and a holder movable longitudinally in the casing whereby its opposite ends may be brought adjacent to their respective ends of the casing and having longitudinal channels for matches, said channels opening toward the opposite ends of the casing, substantially as set forth.

4. A match holder having at each of its opposite ends a series of longitudinal channels 30 for individual matches and supplied with abrading material, cross channels at the ends of the longitudinal channels, and a rib or partition between the adjacent cross channels,

substantially as set forth.

MANUEL F. LUNA.
