## M. DORRITY. INSTEP PAD. APPLICATION FILED NOV. 19, 1906.

## UNITED STATES PATENT OFFICE.

MATTIE DORRITY, OF SYRACUSE, NEW YORK.

## INSTEP-PAD.

No. 879,527.

Specification of Letters Patent.

Patented Feb. 18, 1908.

Application filed November 19, 1906. Serial No. 344,129.

To all whom it may concern:

Be it known that I, MATTIE DORRITY, a citizen of the United States, residing at Syracuse, in the county of Onondaga and State of New York, have invented certain new and useful Improvements in Instep-Pads, of which

the following is a specification.

My invention relates to instep-pads, and its primary object is the production of a pad which is shaped in contour to the natural and normal formation of the sole of the foot so as to support the same and prevent stretching of the ligaments fastened to the bones of the foot, which, when stretched subject a person to excruciating pain extending well up into the leg by reason of the ligaments connecting with parts therein and which pain is invariably considered as rheumatic in nature and is so doctored without beneficial results.

It also has for its object to support the ligaments when stretched so as to maintain

them in normal position.

Other objects are to so construct my improved pad, that it may be placed in the shoe 25 between its sole and the center of the foot and worn without discomfort; to provide means for conveniently and quickly padding the device when compressed by the continual weight thereon of the wearer; to provide a 30 pad having a slitted cover and one or more supplemental pads to be inserted within the cover to serve as additional padding for the device when found necessary; and to so shape and construct the supplemental pads when. 35 more than one is to be used, that they are progressively smaller and may be inserted within the cover of the main pad when compressed so that the original outline and form may be maintained, and which are to be used 40 when found necessary before the main pad is compressed by wear, to raise the instep for comfort, that the pad may be enlarged to meet the requirements of the wearer for ease and comfort.

To these ends the invention consists essentially of a main pad and one or more supplemental pads to be inserted within the cover of the main pad; and it further consists in forming the pad with a thick side edge gradually tapering toward the rear and front of the pad, and in tapering the pad in cross-section from said thickened edge to the opposite side edge; and also in the construction of the same and in the arrangement, and combination of the several parts thereof to be herein-

after described and particularly pointed out in the appended claims.

Referring to the drawings, similar numerals of reference refer to similar parts in the

several figures.

Figure 1 is a central section through a shoe and my improved pad, showing the manner of using the latter. Fig. 2 is a perspective view of my improved pad. Fig. 3 is a cross-section of the pad taken on line 3—3, Fig. 2. 65 Fig. 4 is a longitudinal section taken on line 4—4, Fig. 3. Figs. 5 and 6 are perspective views of the supplemental pads to be used in conjunction with the main pad. Fig. 7 is a central section taken on line 7—7, Fig. 6. 70 Fig. 8 is a cross-section showing the pad "built-up" or enlarged by use of the supplemental pads. Fig. 9 is a longitudinal section taken on line 9—9, Fig. 8.

The numeral 10 designates a shoe showing 75 the foot 11 of the wearer therein, and between the sole of the shoe and the center of the foot my improved instep-pad 12 is located. This pad comprises a main pad 13 and supplemental pads 14 of smaller size 80

than the main pad.

The main pad consists of a filling 15 of soft material formed to the desired shape and an envelop or cover 16 of leather, chamois, or other soft material to receive 85 the filling. Said envelop or cover comprises a top 17 and bottom 18 united at the end edges and one side edge by stitching, and having secured between the edges of the other side, a strip of the covering material 19 90 curved in opposite directions from the center. The filling material is pressed into form or otherwise formed to fill out the envelop so that the top of the pad curves lengthwise from its center to opposite ends and tapers or 95 curves from the inner side edge to the outer side edge. In this manner the top of the pad is shaped to the natural outline of the center portion of the bottom of the foot, and when placed in position, supports the liga- 100 ments of the foot and gives the instep a comely shape. The sides of the pad are curved inward to conform to the outline of the sides of the foot when it contacts with the pad and it is further shaped to the hol- 105 low of the foot by reason of the inner or thickened side of the pad being longer than the outer side, also by curving the ends of the pad outward. In this manner, no part of the pad lies between the foot and the shoe 110

where the foot should naturally bear against the sole of the shoe.

The envelop or cover of the pad is slitted, as at 20, to permit the insertion of one or 5 more supplemental pads, which are designated 14. These supplemental pads may be inserted when first placing the pad in the shoe, but this is rarely found necessary, since the main pad is made of sufficient 10 thickness to meet most all conditions; and as has been experienced, by raising the ligaments gradually, better results are obtained. After the wearer is accustomed to the pad, and he finds an increased thickness 15 desirable, or when the main pad is compressed by constant wear and the weight of the wearer, a supplemental pad may be inserted through the slit in the envelop. These supplemental pads are made progressively 20 smaller; it being the intention to first insert the larger pad between the filling in the main pad and the bottom covering. Each of said supplemental pads are preferably formed as shown in Figs. 5 to 7 and have a 25 substantially semi-circular outline, with the thickest portion of the pad at the straight edge 22, and gradually diminishing in thickness from a point central along said edge to all points of the remaining curved edge. 30 When inserting said supplemental pads within the main pad, the thickened edges thereof are placed against or near the side 19 of the envelop or cover of the main pad, and consequently the latter is built up to retain its 35 original form with increased thickness. If, for example, the pad is first used without the supplemental pads, and it is found that the pad has been compressed, the larger supplemental pad is to be first inserted and the de-40 vice worn in this manner, and when the pad so enlarged becomes compressed to a point where additional building-up would result in more comfort, the second or smaller pad may be inserted between the first supple-45 mental pad and the bottom of the envelop or covering of the main pad.

Having thus described my invention, what

I claim is,—

1. As an article of manufacture, a pad for the foot, comprising a cover having a top and bottom united by stitching at their end edges and at one of their side edges, and having a side piece of flexible covering material sewed between the top and bottom at their remaining side edges, said side piece

diminishing in width from a point between its ends to the end edges of the cover, and

filling material within said cover.

2. As an article of manufacture, a pad for the foot comprising a main pad having a 60 cover consisting of a top and bottom connected at one side edge by a side piece diminishing in width from a point substantially midlength toward opposite ends, said top and bottom being otherwise united at 65 their edges by stitching, filling material within the cover, and a supplemental pad of smaller size than the main pad and of substantially semicircular outline adapted to be placed within said cover between the same 70 and said filling material.

3. As an article of manufacture, a pad for the foot comprising a main pad having a cover consisting of a top and bottom connected at one side edge by a side piece 75 diminishing in width from a point substantially midlength toward opposite ends, said top and bottom being otherwise united at their edges by stitching, filling material within the cover, and a plurality of supplemental pads of smaller size than the main pad and of progressively smaller size with respect to each other adapted to be inserted within said cover between the same and the

filling of the main pad.

4. As an article of manufacture, a pad for the foot comprising a main pad having a cover consisting of a top and bottom connected at one side edge by a side piece diminishing in width from a point substan- 90 tially midlength toward opposite ends, said top and bottom being otherwise united at their edges by stitching, filling material within the cover, and a supplemental pad of smaller size than the main pad and of sub- 95 stantially semicircular outline adapted to be placed within said cover between the same and said filling material, said supplemental pad having a thickened portion along its straight edge gradually diminishing toward 100 opposite ends and tapering from the center of said straight edge toward all points of the remaining curved edge.

In testimony whereof, I have affixed my signature in the presence of two subscribing 105

witnesses.

MATTIE DORRITY.
