C. A. PIEPHO.

COMBINED SHOW CASE AND RECEPTACLE COVER.

APPLICATION FILED AUG. 31, 1908.

UNITED STATES PATENT OFFICE.

CARL A. PIEPHO, OF ST. LOUIS, MISSOURI, ASSIGNOR TO ST. LOUIS TIN & SHEET METAL WORKING COMPANY, A CORPORATION OF MISSOURI.

COMBINED SHOW-CASE AND RECEPTACLE-COVER.

935,054.

Specification of Letters Patent. Patented Sept. 28, 1909.

Application filed August 31, 1908. Serial No. 451,095.

To all whom it may concern:

Be it known that I, Carl A. Piepho, a citizen of the United States, and resident of St. Louis, Missouri, have invented certain new and useful Improvements in Combined Show-Cases and Receptacle-Covers, of which the following is a specification.

My invention relates to an improved combined show case and receptacle cover, and 10 has for its object to provide a receptacle cover having a pocket covered by a transparent window, which may be removed from the receptacle and used for the purpose of independent display.

sectional view of my complete invention, showing it in position on a receptacle. Fig. 2 is a top plan view of the same. Fig. 3 is an enlarged central sectional view. Fig. 4 to form a space between the same and the peripheral rim; a cover having a downwardly projecting flange and arranged to fit the device, showing the same when open.

In the construction of my invention, I provide a plate composed of an imperforate bottom 5, a peripheral rim 6 and a partition 25 wall 7 parallel with said peripheral rim, all rigidly connected together. The partition wall 7 is so located as to form a central display pocket 8 in which are placed samples of the contents of the receptacle upon which 30 the device is used as a cover. On the rim 6 is placed an annular top 9 provided with a depending flange 10 so arranged as to fit inside of the rim 6 to retain the cover in position, said annular top having a central open-35 ing 11 under which is placed transparent material 12 through which the articles in the compartment 8 can be displayed.

The transparent material 12 is held in position by the braces 13 secured to the under surface of the top 9. The cover is hingedly mounted on the rim at the point indicated by the numeral 14 by means of the hinge 15 so that the cover can be readily operated as

shown in Fig. 4, when it is desired to remove or replace the articles for display. On 45 opposite sides of the device I place handles 16 by which the device can be readily removed from and replaced on the receptacle. On the bottom 5 I provide an eye 17 by which the entire device can be hung up on 50 the wall or elsewhere.

Having thus fully described my invention, what I claim as new and desire to have secured to me by the grant of Letters Patent, is:

A combined show case and receptacle cover comprising an imperforate bottom; a peripheral rim formed integral with said bottom; a partition wall projecting upwardly from said bottom and so located as 60 peripheral rim; a cover having a downwardly projecting flange and arranged to fit within the peripheral rim; said cover projecting inwardly covering the space formed 65 by the partition wall and peripheral rim and provided with a central opening; a plate of transparent material located beneath the central opening and contacting with the inturned edge of the cover; braces carried by 70 the cover and contacting with the transparent material holding the same in position so as to be conveyed with the cover; handles attached to the peripheral rim so that the device may be removed from its position on 75 the receptacle; and an eye attached to the bottom, whereby the device may be suspended independent of the receptacle, substantially as specified.

In testimony whereof, I have signed my 80 name to this specification, in presence of two subscribing witnesses.

CARL A. PIEPHO.

Witnesses:

James L. Hopkins, Walter C. Stein.
