UNITED STATES PATENT OFFICE.

JOHN WATSON MYERS, OF TOLEDO, OHIO.

PENCIL-HOLDER.

935,393.

Specification of Letters Patent. Patented Sept. 28, 1909.

Application filed May 7, 1909. Serial No. 494,607.

To all whom it may concern:

Be it known that I, JOHN WATSON MYERS, a citizen of the United States, residing at Toledo, in the county of Lucas and State of Ohio, have invented certain new and useful Improvements in Pencil-Holders; and I do hereby declare the following to be a full, clear, and exact description of the invention, such as will enable others skilled in the art to which it appertains to make and use the same.

This invention relates to holders for retaining pencils, pens, and other similar articles, in the vest pocket; and it consists in the novel construction of the parts hereinafter fully described and claimed.

In the drawings, Figure 1 is a front view of the holder; and Fig. 2 is a side view of the holder, drawn to an enlarged scale for clearness.

A is the stem of the holder formed of three wires twisted together spirally. The end portions *b* and *c* of two of these wires are springs and are arranged in one plane and have inwardly projecting points *b'* and *c'* at their lower ends. The end portion *d* of the remaining wire is also a spring, and it is arranged at a little distance from the springs *b* and *c*, in a different plane, and about midway between them. The end portion or spring *d* has a point *d'* at its lower end which projects outwardly in the opposite direction to the points *b'* and *c'*. The cloth *e* of the front part of the pocket, shown in dotted lines, is engaged by the sharp

points so that the device is firmly secured to the vest of the wearer. One of the said wires projects at the top of the shank and is formed into a helical coiled spring H. This spring is preferably conical and is largest at its upper end. The axis of the spring H is arranged to one side of the shank A, so that the spring comes over the opening of the pocket. The pencil *h*, or other similar article, shown in dotted lines, is thrust into the coiled spring H and is held securely by it with its point inside the vest pocket.

The size of the spring H can be adjusted to any size of pencil or pen by twisting or untwisting the coils of the spring.

What I claim is:

1. A holder comprising a shank formed of three twisted wires, three springs formed of the lower end portions of the said wires and adapted to clip the garment, and a helical coiled spring at the top of the said shank which projects to one side of the shank.

2. A holder comprising a shank formed of three twisted wires, three springs formed of the lower end portions of the said wires and adapted to clip the garment, and a helical coiled spring formed of a continuation of one of the said wires at the top of the shank.

In testimony whereof I have affixed my signature in the presence of two witnesses.

JOHN WATSON MYERS.
