

M. D. FERGUSON.
AMUSEMENT APPARATUS.
APPLICATION FILED JULY 30, 1908.

956,488.

Patented Apr. 26, 1910.

UNITED STATES PATENT OFFICE.

MARTIN D. FERGUSON, OF LOS ANGELES, CALIFORNIA.

AMUSEMENT APPARATUS.

956,488.

Specification of Letters Patent. Patented Apr. 26, 1910.

Application filed July 30, 1908. Serial No. 446,087.

To all whom it may concern:

Be it known that I, MARTIN D. FERGUSON, a subject of the King of England, and a resident of Los Angeles, in the county of Los Angeles and State of California, United States of America, have made certain new and useful Improvements in Amusement Apparatus, of which the following is a specification.

This invention is an improvement in amusement apparatus, including an umbrella or sun shade, for use on lawns, parks, play grounds, etc., and a round-a-bout device for use in connection therewith; and the invention consists in certain novel constructions and combinations of parts as will be hereinafter described and claimed.

In the drawing—Figure 1 is an elevation partly in section of an apparatus embodying my invention. Fig. 2 is a detail perspective view of the upper portion of the upright, and Fig. 3 is a detail perspective view of one of the travelers, and Fig. 4 is a partial plan view showing spacing bars between the carriers.

In carrying out the invention I employ a base A, which may be sunk in the ground and has a tapered socket A' to receive a suitable tenon B' on the lower end of the upright B. The base A and the upright B may be of any suitable metal and the upright B is hollow and is provided with a cross plate B² perforated at B³ for drainage purposes, and at its upper end the upright B has the central tube B⁴ which forms a guide for the umbrella rod C, which latter seats at its lower end in a socket B⁵ in the cross plate B², as best shown in Fig. 1. This central tube B⁴ forms an annular channel B⁶ within the upright at the upper end thereof and this channel B⁶ receives the depending arms D' of the traveling carriers D, which travelers have laterally extending arms D² supported on and movable along the upper edge B⁷ of the upright as a track, and by preference grooved rollers D³ are provided to run upon the track B⁷ and rollers D⁴ at the lower ends of the depending arms D' to operate within the channel B⁶ and thus relieve friction in the operation of the invention as more fully described hereinafter.

The carriers D are designed to form supports from which hammocks, chairs, swings, or gymnasium devices may be suspended as will be understood from Fig. 1, and the carriers may be moved around the upright B

below the umbrella E for amusement purposes or for shifting out of the sun in the use of the invention. The carriers D are especially designed, when the holder is made of iron, as supports from which may be suspended chairs, swings, hammocks or the like for children so the said devices may be moved around by the hand and thus kept in the shade, no operating means being provided. When the holder is made of pottery the carrier may be utilized as supports for swinging flower baskets or other ornaments.

The umbrella has suitable ribs E' and stretchers E² so it may be raised and lowered and is provided with a depending curtain or valance F, and is surmounted by a flag G as best shown in Fig. 1.

The holders H for flowers or the like are carried by the upright B and communicate therewith through openings H' for drainage purposes, the said holders and the upright B being preferably finished in the similitude of a tree trunk and branches to give an attractive appearance to the device when used upon lawns.

Screws B¹⁰ may be arranged as shown in Fig. 1 to secure the tenon B' in the socket A', and at the lower end of the base A I provide a lateral flange A¹⁰ which steadies the anchorage of the base in the ground.

In operation any suitable devices such as hammocks, chairs or swings, may be suspended from the traveling carriers and the latter be moved around the support below the umbrella E and by fitting the upright detachably to its base, the umbrella, etc., may be stored under shelter during the cold weather. I also provide on the upright B studs or projections I on which cards bearing the number of the house or the profession of the occupant may be suspended as shown in Fig. 1 of the drawing.

In Fig. 4 I show a spacing bar D¹⁰ for holding the carriers D at proper distances apart.

When the apparatus is designed for supporting hammocks, swings, etc., it may be preferred to make the base and upright B of iron or other suitable metal, but when simply used as a holder for the umbrella and for flowers, the said parts may be made of any suitable form of pottery or stone ware.

I claim—

1. An amusement apparatus comprising

an upright provided at its upper end with an annular chamber and traveling carriers having arms depending within said chamber and provided with rollers operating 5 therein and also having lateral arms and rollers bearing upon the upper edge of the upright as a track, substantially as and for the purpose set forth.

2. The combination in an apparatus of an 10 upright having an annular chamber opening at its upper end and having said upper end adapted to form a track, and a traveling carrier having a depending arm operating in the annular chamber, and a lateral arm 15 supported on the track-like upper end of the upright, substantially as set forth.

3. An amusement apparatus comprising an upright having an annular chamber at its upper end, and provided at its upper end 20 surrounding said chamber with a circular track, a carrier having a depending arm operating in said chamber, and provided on said arm below the upper end of the chamber with a roller having a vertical axis op- 25 erating in said chamber, the carrier having a lateral arm extending outwardly from said depending arm over the circular track, and a roller journaled on said arm and having an approximately horizontal axis and 30 operating upon the circular track at the upper end of the annular chamber.

4. An amusement apparatus comprising an upright provided at its upper end with an annular chamber, and a series of traveling carriers independent of each other and 35 having at their inner ends arms depending within said chamber, and rollers on the said carriers adjacent to said arms and bearing upon the upper edge of the upright as a track, substantially as and for the purpose 40 set forth.

5. An amusement apparatus comprising an upright having its upper end circular in cross section and provided in said upper end with a central portion concentric with 45 the circular upper end of the upright and having its outer side circular whereby to cooperate with the upper end of the upright in forming an annular chamber at such end of the upright, and a series of carriers each 50 independent of the others and provided at their inner ends with arms depending within said annular chamber and between the central tube and the walls of the upright, rollers on the said depending arms, and 55 rollers on the carriers and operating upon the upper circular end of the upright, substantially as set forth.

MARTIN D. FERGUSON.
