UNITED STATES PATENT OFFICE.

ISAAC J. BALSTON, AND JESSE BRIGGS, OF KANE, PENNSYLVANIA, ASSIGNORS OF
ONE-THIRD TO HUGO J. WALTER, OF KANE, PENNSYLVANIA.

GLASS-DRAWING FURNACE.

958,525.

Specification of Letters Patent.

Patented May 17, 1910.

Original application filed June 5, 1909, Serial No. 500,304. Divided and this application filed October 28,
1909. Serial No. 525,004.

To all whom it may concern:

Be it known that we, ISAAC J. BALSTON and JESSE BRIGGS, both citizens of the United States, and residents of Kane, in the county of McKean and State of Pennsylvania, have invented a new and Improved Glass-Drawing Furnace, of which the following is a full, clear, and exact description.

This invention relates to a new and improved furnace suitable to melt glass therein and from which glass cylinders may be drawn in a convenient and efficient manner, and is a division of our application, Serial No. 500,304, filed June 5, 1909.

An object of the invention is to provide a new type of furnace, which will be simple in construction, readily accessible, and which will permit clean and uniform cylinders to be drawn therefrom.

A further object of this invention is to provide a glass-drawing furnace, with means for protecting a plurality of baths therein and with means for forming and protecting a clean drawing surface.

These and further objects, together with the construction and combination of parts, will be more fully described hereinafter and particularly set forth in the claims.

Reference is to be had to the accompanying drawings forming a part of this specification, in which similar characters of reference indicate corresponding parts in all the views, and in which—

Figure 1 is a fragmentary plan view, showing an arrangement of the extension to the furnace; Fig. 2 is a horizontal fragmentary section; Fig. 3 is an enlarged vertical section on the line 3—3 in Fig. 1, through one of the dog-houses; Fig. 4 is a vertical section on the line 4—4 in Fig. 1, through the cover-plate for a bath, and the boot and ring therein; and Fig. 5 is a plan view of a cover-plate with the boot attached.

Referring more particularly to the separate parts of the device, 1 indicates a furnace, which may be made of any suitable form and material, and preferably consists of suitable fire-proof masonry reinforced by suitable buck-stays 2, which are secured together in any suitable manner, as by means of adjustable tie-rods 3. On any or all of the sides of the furnace 1, there is provided a suitable extension 4, which forms a bath

from which the glass cylinders may be drawn. This extension has a plurality of so-called "dog-houses" 5, which are in the form of arched inclosures, each having an opening 6 in the end thereof, to permit access to the interior of the dog-house and the furnace proper.

Intermediate the dog-houses, there are provided a plurality of walls 7, which are built up above the level of the bath in the extension, and provide a means for protecting the buck-stays 2, which are located therein for supporting the main wall of the furnace. Between the walls 7 and the walls of the dog-house 5, there are left a plurality of open baths, from which a plurality of glass cylinders may be drawn. These baths are adapted to be protected by suitable cover-plates 8, which are adapted to be supported in any suitable manner on the front wall of the extension 4, and on the walls 7 which protect the buck-stays. There is provided in each of these cover-plates 8 a suitable opening 9, through which the glass cylinders may be drawn.

In order that the scum on the surface of the glass bath may not be drawn up by the glass-drawing mechanism, and in order to form a cylinder of clear and uniform structure, there is provided a plurality of rings 10, preferably three for each cover-plate, which are adapted to be successively located in substantial alinement with the openings 9 in the cover-plates 8. In order to hold the rings 10 in substantial alinement with the openings 9, there is provided a suitable boot 11, which is in the form of a ring having an outwardly-flared bottom, slightly larger than the ring 10, and in which the ring 10 is adapted to rest. The boot 11 is removably supported by any suitable means, such as trunnions 12, on a ring-support 13, which is pivoted in any suitable manner to the plate 8, as at 14, and is suitably counter-weighted by means of an adjustable weight 15, which is secured to an extension of the support 13, on the opposite side of its pivot-point 14.

The support 13 is adapted to be locked in various adjusted positions relative to the plate 8 by means of a pin 18, which is adapted to engage suitable openings in a bracket 16, secured in any well-known manner to the plate 8, and also engages an opening in the

extension 17 on the support 13. The extension 17 has a hand-hold 19 thereon, whereby the support 13 may be manipulated.

The peculiar construction of the alternate
5 baths and dog-houses forms clean and hot
drawing baths, and permits ready access into
the interior of the furnace for skimming the
bath, and for manipulating the rings 10.
The use of three rings, to substitute one for
10 the other, permits a clean and thoroughly
heated ring to be used at each drawing op-
eration without any unnecessary delay.

Having thus described our invention, we
claim as new and desire to secure by Letters
15 Patent:

1. In a device of the class described, the
combination with a furnace, of an extension
on said furnace having a plurality of draw-
ing baths, and a plurality of dog-houses jux-
20 taposed to said baths.

2. In a device of the class described, the
combination with a furnace, of an extension
on said furnace, a plurality of dog-houses
on said extension, and a plurality of draw-
25 ing baths interposed between said dog-
houses.

3. The combination with a furnace, of an
extension on said furnace, a plurality of dog-
houses on said extension having a plurality
30 of drawing baths interposed between them,
and a cover-plate for each of said baths hav-
ing an opening therein.

4. In a device of the class described, the
combination with a furnace, of an extension
35 on said furnace having a plurality of draw-
ing baths, and a plurality of dog-houses jux-
taposed to said baths, said dog-houses being
in communication with said baths and said
furnaces, whereby a plurality of inter-
40 changeable rings may be manipulated suc-
cessively between said baths and said fur-
nace.

5. In a device of the class described, the
combination with a furnace, of an extension

on said furnace, having a drawing bath, and 45
a dog-house arranged alongside of said bath,
said dog-house being in communication with
said bath and said furnace, whereby a plu-
rality of interchangeable rings may be suc-
cessively manipulated between said bath and 50
said furnace.

6. In a device of the class described, the
combination with a furnace, of a drawing
bath on said furnace, a cover-plate for said
drawing bath, having an opening therein, a 55
support adjustably connected to said cover-
plate in juxtaposition to said opening, and
a boot pivotally connected to said support
on a horizontal axis.

7. In a device of the class described, the 60
combination with a furnace, having a draw-
ing bath, of a cover-plate for said drawing
bath, having an opening therein, a support
pivotally connected to said plate, means for
adjusting said support, means for locking 65
said support in any adjusted position, and a
boot swingingly connected to said support.

8. In a device of the class described, the
combination with a furnace, having a draw-
ing bath, of a cover-plate for said drawing 70
bath, having an opening therein, a support
pivotally connected to said plate, means for
adjusting said support, means for locking
said support in any adjusted position, and a
boot swingingly connected to said support, 75
said boot being flared at the bottom, whereby
it is adapted to successively hold in coop-
eration therewith a plurality of interchange-
able rings.

In testimony whereof we have signed our 80
names to this specification in the presence
of two subscribing witnesses.

ISAAC J. RALSTON.
JESSE BRIGGS.
