UNITED STATES PATENT OFFICE.

FREDERIC W. SAVAGE, OF GRANVILLE, NEW YORK.

WATERPROOF BOOT.

966,774.

Specification of Letters Patent.

Patented Aug. 9, 1910.

Application filed February 13, 1909. Serial No. 477,773.

To all whom it may concern:

Be it known that I, FREDERIC W. SAVAGE, a citizen of the United States, residing at Granville, county of Washington, and State 5 of New York, have invented new and useful Improvements in Waterproof Boots, of which the following is a specification.

My invention relates to waterproof boots shown in an application for Letters Patent 10 filed by me May 1, 1906, Serial No. 314,623, and has for its object to provide certain improvements in the same consisting of an improved top for the same which will not only be waterproof, but will fit any sized leg, 15 and may be buckled, laced or otherwise fastened to be drawn snug to the leg of the wearer, whereby access of moisture at the top thereof will be prevented and the article retained in its adjusted position without 20 sagging.

In the accompanying drawing:—Figure 1 is a perspective view of a boot embodying one form of my invention. Fig. 2 is a similar view embodying a modified construc-

25 tion.

Rubber boots heretofore when extended above the knee have had said extensions made of thin rubber which is not only easily. cracked or torn, but because of their size 30 and flexibility tend to gap open at the top and to sag down. This difficulty I propose to remedy by providing the boot with what is known as a "bellows" plait or tongue, located either in the front or back or in 35 either side of the extension, and extending from any point above the boot proper to the top of the extension. By this construction ample room may be left for the insertion of the foot of the wearer, and when the boot is 40 adjusted in position on the leg said "bellows" plait or tongue may be drawn together at its edges, by suitable lacing, buckles, or other fastening means, whereby a snug fit will be assured and any sagging 45 prevented.

Referring now to the drawing, and particularly to Fig. 1 thereof, I have shown a rubber boot 1 formed up to the knee like the ordinary knee boot, and extended from 50 the knee to the hip or thigh at 2, said upper |

of rubber or waterproof material, the edges' of the slit formed in the upper leg portion to receive said plait or tongue being pro- 55 vided with eyelets 4 to receive a lacing cord, or with buckles 5 of any desired construction, or with both. Said boot is manufactured as follows: The several parts constituting the sole, foot portion and leg portion 60 are assembled upon a last and cemented and pressed into shape in the usual manner, the upper leg portion having been previously split, as shown, and having attached thereto by cementing and stitching the "bellows" 65 plait or tongue 3. The article is then vulcanized as a whole, whereby the line of connection between said plait or tongue 3 and the upper leg portion 2 is made watertight, and with the eyelets 4, or buckles 5, or both, 70 added, is ready for use.

In Fig. 2 I have shown a somewhat different construction wherein the boot 11 is provided with an upper leg portion formed preferably of waterproofed duck, and pro- 75 vided in its rear, with a "bellows" plait or tongue 12 extending from its top down to the top of the boot 11 proper. This article is manufactured as follows: The several parts of the boot 11 are assembled upon the 80 last and cemented and pressed into shape ready for vulcanization. The upper legportion, which has been split and had cemented and sewed thereto the plait or tongue 12, is then cemented to the upper edge of 85 said boot 11, and the article as a whole then vulcanized. The same being finished by adding eyelets or buckles, or both, is ready for use.

It will be understood that I do not limit 90 myself to any particular length of "bellows" plait or tongue, as the same may extend from the top of the leg portion down to any point above the boot proper, and may be located in either side or the front or lear 95 of said boot. So also, I may form the upper leg portion of any suitable waterproof material, such as rubber or waterproofed duck, the latter being extremely durable, much more so than rubber. I may also form the 100 whole leg and foot portion of the boot of waterproofed duck and connect it to a rubleg portion being provided in one side with | ber insole, to which an outer-sole of leather a "bellows" plait or tongue 3 also formed or other suitable material is fastened, as

described in an application for Letters Patent filed by me February 10, 1909, Serial No. 477,131.

Having thus described my invention, what I claim as new and desire to secure by Letters Patent is:

A boot formed of waterproof material and provided with a flexible extension above the knee, and a bellows plait or gusset also of waterproof material located in said ex-

tension and extending to the top of said extension, all of said parts being united waterproof.

In testimony whereof I have hereunto set my hand in the presence of two subscribing 15 witnesses.

FREDERIC W. SAVAGE.
