UNITED STATES PATENT OFFICE.

PAUL GALLREIN, OF MARKNEUKIRCHEN, GERMANY.

SUSPENDING-TAB FOR GARMENTS.

995,781.

Specification of Letters Patent. Patented June 20, 1911.

Application filed May 24, 1909. Serial No. 498,078.

To all whom it may concern:

Be it known that I, PAUL GALLREIN, a subject of the King of Saxony, residing at Markneukirchen, in the Kingdom of Saxony, Germany, have invented certain new and useful Improvements in Suspending-Tabs for Garments, of which the following is a specification.

The tabs commonly used for the suspension of garments from hooks or pegs are liable to be torn from the clothing and to become worn through by reason of the fact that the friction incurred always takes place at the same part of the tab, namely midway between the ends of the same.

The object of the present invention is to remove these disadvantages, and to prevent accidental detachment of the tab. Inasmuch as the tab can move freely in two holes or eyes, all parts thereof are subjected to equal wear, and the life of the tab is by this means lengthened. In case of need a broken tab of this kind may be replaced by a piece of string. The tab may consist of cord, tape, leather or the like, or of a metal chain. For protecting the edges of the holes in the garment, a perforated strip or plate of strong material may be fastened to the perforated part of the garment and said plate may have tubular bosses extending through the holes, or two strips or plates may be used, one at each side of the perforated material of the garment.

One of the several possible embodiments of my invention is illustrated in the drawings which accompany and form a part of this specification in which—

Figure 1 is a section of the reinforcing strips before application to the garment, Fig. 2 is a section of my improved device, and Fig. 3 is a plan view with the tab omitted.

In the figures, 1 represents a perforated portion of a garment, and 4, 5 are reinforce-

ments or protecting strips applied thereto. The strip 5 is provided with perforations which register with those in the garment and the strip 4 is provided with integral eyelets which pass through the tab holes in the garment and the perforations in the cooperating strip 4 and are afterward bent over as shown in Fig. 2, so that the inner surfaces thereof are smoothly rounded and the tab can slide thereon with a minimum of friction.

3 represents an endless tab which passes through the eyelets as shown. The outer portion of the tab is normally concealed by the collar of the garment. If desired a strip of material may be attached to the garment to cover this portion of the tab and conceal it when the collar is turned up.

What I claim as my invention and desire to secure by Letters Patent of the United States is:—

1. The combination with a garment having two tab-holes, of reinforcing strips having perforations registering with said tab-holes and arranged on opposite sides of the garment, eyelets passing through said tab-holes and perforations, and an endless tab passing through said eyelets.

2. The combination with a garment having two tab holes, of reinforcing strips having perforations registering with said holes and arranged on opposite sides of the garment, eyelets integral with one of said strips passing through said tab-holes and the perforations in the cooperating strip, and an endless tab passing through said eyelets.

In witness whereof I have signed this specification in the presence of two witnesses.

PAUL GALLREIN.
