SUMMARY OF THE INVENTION

Problems to be Solved by the Invention

The inventors of the present invention previously disclosed a process that proceeds from a compound represented by Formula (3) through a compound represented by Formula (4) and a process that proceeds from a compound represented by Formula (5) through a compound represented by Formula (6) and a compound represented by Formula (7) in the following Scheme 2 as a process for producing the aforementioned compound represented by Formula (IV), and particularly a compound represented by Formula (IV-1), but during the course of studying a process for enlarging the production scale of the development candidate, the processes were shown to not necessarily be industrially optimal process for reasons that, in addition to the former having only a moderate yield when proceeding from a compound represented by Formula (2) to the compound represented by Formula (3) and from the compound represented by Formula (3) to the compound represented by Formula (4), synthesis of the compound represented by Formula (IV) from the compound represented by Formula (4) did not have a satisfactory yield due to low reactivity attributed to steric hindrance of the environment surrounding the carboxyl group as well as purification loss during removal of byproduct, while the latter had low yield from the compound represented by Formula (7) to the compound represented by

3

Formula (IV), and results in increased production costs due to the introduction of an  $R^3O-NH$  side chain early in the process:

(wherein OBn is benzyloxy, TFA is 2,2,2-trifluoroacetyl, Boc is tert-butoxycarbonyl, Teoc is 2-trimethylsilylethoxycarbonyl, and R<sup>3</sup> is same as will be subsequently described).

While intramolecular ureation was attempted after using an active group as X of the compound represented by the aforementioned Formula (5) and deprotecting, the active group also ended up being removed under the conditions used for deprotection, or only a complex mixture was obtained due to the occurrence of decomposition caused by an intermolecular reaction occurring under the conditions of phosgenation. In addition, although an attempt was made to isolate an intermediate introduced with an active group from the compound represented by the aforementioned Formula (4), the desired compound was able to be obtained only in a moderate yield due to the low reactivity of the compound represented by Formula (4). Next, phosgenation, deprotection and then cyclization reaction were attempted on a compound represented by Formula (8) or a compound represented by Formula (9) in the following Scheme 3 as a

4

preliminary study conducted for the purpose of obtaining the compound represented by Formula (IV) without proceeding from the compound represented by the aforementioned Formula (6) through the compound represented by Formula (7). As a result, although a compound represented by Formula (10) was able to be derived from the compound represented by Formula (8) without any problems without having to add an activating agent such as 4-dimethylaminopyridine during cyclization reaction, the desired compound represented by Formula (11) was indicated to be unable to be obtained at all from the compound represented by Formula (9).

With the foregoing in view, the inventors of the present invention conducted extensive studies on a novel and efficient process for producing a compound represented by the aforementioned Formula (IV) with the aim of developing a process for producing a compound represented by Formula (VI) industrially.

(In the above formulas, OBn is benzyloxy, and Boc is tert-butoxycarbonyl.)

#### Means for Solving the Problems

The present inventors introduced various active groups employed in peptide synthesis for R<sup>1</sup> into the carboxyl group of a compound represented by Formula (I) of the following Scheme 4 instead of direct activation of the less reactive carboxyl group of the compound represented by the aforementioned Formula (4), and examined a synthetic process that goes through a compound represented by Formula (III) to a compound represented by Formula (IV). In particular, in the case of a compound having a 2,5-dioxopyrrolidin-1-yl, 1,3-dioxo-3a,4,7,7a-tetrahydro-1H-isoindol-2(3H)-yl, 1,3-dioxohexahydro-1H-isoindol-2(3H)-yl, or 3,5-dioxo-4-azatricyclo[5.2.1.0<sup>2,6</sup>]dec-8-en-4-yl group as R<sup>1</sup> represented by Formula (II), the present inventors found that a protecting group P is selectively deprotected without having an effect on the active group under mildly acidic conditions following phosgenation, that the reaction subsequently proceeds continuously through the cyclization reaction by treating the reaction solution with a base, and that a compound repre-

5

sented by Formula (III) is obtained in a satisfactory yield. Moreover, the present inventors succeeded in deriving the compound represented by Formula (IV) without producing byproduct and in high yield by directly reacting the resulting compound represented by Formula (III) with  $R^3ONH_2$  than the process that goes through the compound represented by the aforementioned Formula (4):

(wherein P is an NH protecting group capable of being removed with an acid,  $R^1$  is 2,5-dioxopyrrolidin-1-yl, 1,3-dioxo-3a,4,7,7a-tetrahydro-1H-isoindol-2(3H)-yl, 1,3-dioxohexahydro-1H-isoindol-2(3H)-yl, or 3,5-dioxo-4-azatricyclo[5.2.1.0<sup>2,6</sup>]dec-8-en-4-yl,  $R^2$  is hydrogen, ClCO— or Cl<sub>3</sub>COCO— and  $R^3$  is same as will be subsequently described).

Namely, (1) the present invention relates to a process for producing a compound represented by the following Formula (IV):

[Chemical Formula 5]

6

comprising: reacting a compound represented by general Formula (I):

5 [Chemical Formula 6]

15 with  $R^1OH$  selected from 1-hydroxypyrrolidin-2,5-dione, 2-hydroxy-3a,4,7,7a-tetrahydro-1H-isoindol-1,3(2H)-dione, 2-hydroxyhexahydro-1H-isoindol-1,3(2H)-dione, and 4-hydroxy-4-azatricyclo[5.2.1.0<sup>2,6</sup>]dec-8-ene-3,5-dione followed by allowing a carbonylation agent selected from phosgene, diphosgene and triphosgene to act thereon to obtain a compound represented by the following Formula (II):

25 [Chemical Formula 7]

35 removing a protecting group P and treating with a base to obtain a compound represented by the following Formula (III):

40 [Chemical Formula 8]

45 and reacting with a compound:  $R^3ONH_2$  (in the aforementioned Formulas (I), (II), (III) and (IV), OBn is benzyloxy, P is an NH protecting group capable of being removed with an acid,  $R^1$  is 2,5-dioxopyrrolidin-1-yl, 1,3-dioxo-3a,4,7,7a-tetrahydro-1H-isoindol-2(3H)-yl, 1,3-dioxohexahydro-1H-isoindol-2(3H)-yl, or 3,5-dioxo-4-azatricyclo[5.2.1.0<sup>2,6</sup>]dec-8-en-4-yl,  $R^2$  is hydrogen, ClCO— or Cl<sub>3</sub>COCO—,  $R^3$  is C<sub>1-6</sub> alkyl or heterocyclyl, or forms a 3- to 7-membered heterocyclic ring together with the adjacent —O—NH—.  $R^3$  may be modified with 0 to 5  $R^4$ , and  $R^4$  may be consecutively substituted. Here,  $R^4$  is C<sub>1-6</sub> alkyl, C<sub>1-6</sub> alkoxy, C<sub>1-6</sub> alkylsulfonyl, heterocyclyl, heterocyclylcarbonyl,  $R^5$ ( $R^6$ ) N— or a protecting group.  $R^5$  and  $R^6$  are each independently hydrogen or C<sub>1-6</sub> alkyl or together form a 3- to 7-membered heterocyclic ring. Further,  $R^3$ ,  $R^5$  and  $R^6$  can undergo ring closure at an arbitrary position).

7

In addition, (2) another aspect of the present invention relates to a process for producing a compound represented by Formula (IV), comprising: allowing a carbonylation agent selected from phosgene, diphosgene and triphosgene to act on a compound represented by the following Formula (II), wherein R<sup>2</sup> is hydrogen:

[Chemical Formula 9]

followed by removing the protecting group P, treating with a base and further reacting with a compound: R<sup>3</sup>ONH<sub>2</sub> to produce the compound represented by the following Formula

[Chemical Formula 10]

(in the aforementioned Formulas (II) and (IV), OBn, P, R<sup>1</sup>, R<sup>2</sup> and R<sup>3</sup> are same as described above).

## Effects of the Invention

The present production process is a process for efficiently obtaining a compound represented by the aforementioned Formula (IV) both more easily and in higher yield than by going through a compound represented by Formula (2) to a compound represented by Formula (4) of the aforementioned Scheme 2. The carboxyl group of the compound represented by the aforementioned Formula (I) can be more easily modified than the carboxyl group of a compound represented by Formula (4). Intramolecular ureation of a compound represented by Formula (II) easily proceeds in higher yield than a compound represented by Formula (2). In the reaction between the carboxyl group of the compound represented by the aforementioned Formula (4) and the  $R^3ONH_2$  group, although a large amount of byproducts were formed and a satisfactory yield was unable to be obtained due to steric hindrance of the environment surrounding the carboxyl group even if carried out using a commonly employed dehydration condensation agent or mixed acid anhydride method, since an intermediate in the form of a compound represented by the aforementioned Formula (III) has an active ester, it is a highly versatile compound that enables the compound represented by the aforementioned Formula (IV) to be derived more selectively and directly. In particular, instead of going through the compound represented by Formula (4), the compound represented by the aforementioned Formula (III-58) can be obtained in high yield by continuously synthesizing from the compound represented by Formula (I) that is quantitatively obtained from the compound represented by Formula (2) without isolating the compound represented by Formula (II) as indicated in the following Scheme 5, demonstrates storage stability equal to that of the compound represented by Formula (4), and allows the compound represented by Formula (IV), and particularly the compound represented by

13

the following Formula (IV-1-1), to be obtained in high purity and high yield without forming byproduct simply by subjecting to extraction and washing treatment, thereby offering numerous advantages in terms of attempting to realize industrialization. The process for producing the compound 5 represented by Formula (IV), and particularly the compound represented by Formula (IV-1-1), according to the present invention is highly useful as a production process suitable for commercialization of compounds represented by the aforementioned Formula (VI-1).
