**CROSS-REFERENCE TO RELATED
APPLICATIONS**

The entire content of these applications is hereby incorporated herein by reference.

The present invention relates to organic compounds useful for therapy and/or prophylaxis in a human, and in particular to Hepatitis B virus (HBV) inhibitors by targeting on HBV capsid for the treatment of HBV infection.

FIELD OF THE INVENTION

The present invention relates to novel 6-fused heteroaryl-dihydropyrimidines having pharmaceutical activity, their manufacture, pharmaceutical compositions containing them and their potential use as medicaments.

The present invention relates to compounds of formula (I)

wherein R¹ to R⁶, X, Y, W and n are as described below, or to pharmaceutically acceptable salts, or to enantiomers or diastereomers thereof.

HBV is a species of the hepadnaviridae family of viruses. HBV is a serious public health problem worldwide, with more than 400 million people especially in Asia-pacific regions chronically infected by this small enveloped DNA virus. Although most individuals seem to resolve the infection following acute symptoms, 15-40% of HBV patients will finally develop clinical diseases during their lifespan, most notably, hepatitis, liver cirrhosis, and hepatocellular carcinoma. Every year 500,000 to 1 million people die from the end stage of liver diseases caused by HBV infection.

HBV lifecycle begins with the binding of the "Dane" particle with an unidentified receptor on the surface of hepatocyte. Following entry, viral genome is delivered into nucleus where a covalently closed circular DNA (cccDNA) is formed through DNA repair of viral relaxed circular DNA. Unlike the mechanisms of most other DNA viruses, HBV cccDNA replicates through the retrotranscription of a 1.1-

2

genome unit-length RNA copy (pregenomic RNA). Viral pregenomic RNA interacts with other two viral components, capsid protein and polymerase, as well as some host factors, to form capsid particles where viral DNA replication occurs. Most copies of the encapsidated genome then efficiently associate with the envelope proteins for virion assembly and secretion; a minority of these genomes is shunted to the nucleus, where they are converted to cccDNA.

Currently, there are two types of anti-HBV agents on the market, nucleoside (tide) analogs targeting viral polymerase (lamivudine, adefovir, tenofovir, telbivudine and entecavir) and interferon modulating host immune functions. Mutations in the primary sequence of the polymerase that confer resistance to lamivudine and adefovir have been identified clinically and underlie a rebound of serum virus titers that 70% of treated patients experience within 3 years of the start of lamivudine therapy. Although resistance to telbivudine, adefovir, and entecavir occurs more rarely, it has been recorded. Interferon alpha is the other major therapy available for hepatitis B, but it is limited by a poor long-term response and debilitating side effects. Some viral genotypes do not show good responses to interferon therapy. Now, the standard of clinic cure of HBV infection is the loss and/or seroconversion of HBsAg. The majority (around or more than 90%) of treated patients fail to achieve this goal. This drawback is mainly due to the presence of a stable pool of viral cccDNA in nucleus that doesn't replicate itself, therefore, shows no accessibility to nucleoside (tide) analogs.

Hence, there is certainly a medical need for treatments with improved characteristics and for a diversity of approaches in the development of therapies for HBV infection.

HBV capsid protein plays essential roles in HBV replication. HBV has an icosahedral core comprising of 240 copies of the capsid (or core) protein. The predominant biological function of capsid protein is to act as a structural protein to encapsidate pre-genomic RNA and form immature capsid particles in the cytoplasm. This step is prerequisite for viral DNA replication. The HBV capsid spontaneously self-assembles from many copies of core dimers present in the cytoplasm. It has been shown that the formation of a trimeric nucleus and the subsequent elongation reactions occur by adding one dimeric subunit at a time until it is complete. Besides this function, capsid protein regulates viral DNA synthesis through different phosphorylation status of its C-terminal phosphorylation sites. When a near full-length relaxed circular DNA is formed through reverse-transcription of viral pregenomic RNA, an immature capsid becomes a mature capsid. On one hand, capsid protein might facilitate the nuclear translocation of viral relaxed circular genome by means of the nuclear localization signals located in the Arginine-rich domain of the C-terminal region of capsid protein. In nucleus, as a component of viral cccDNA minichromosome, capsid protein could play a structural and regulatory role in the functionality of cccDNA minichromosomes. Capsid protein also interacts with viral large envelope protein in endoplasmic reticulum and triggers the release of intact viral particles from hepatocytes.

There has been a couple of capsid related anti-HBV inhibitors reported. For example, phenylpropenamide derivatives, including compounds named AT-61 and AT-130 (Feld J. et al. *Antiviral Research* 2007, 168-177), and a class of thiazolidin-4-ones from Valeant R&D (WO2006/033995), have been shown to inhibit pgRNA packaging. A recent study suggested that phenylpropenamides are, in fact, accelerators of HBV capsid assembly, and their actions result in the formation of empty capsids. These very interesting results illustrate the importance of the kinetic pathway in successful virus assembly.

3

Heteroaryldihydropyrimidines or HAP, including compounds named Bay 41-4109, Bay 38-7690 and Bay 39-5493, were discovered in a tissue culture-based screening (Deres K. et al. *Science* 2003, 893). These HAP analogs act as synthetic allosteric activators and are able to induce aberrant capsid formation that leads to degradation of the core protein. HAP analogs also reorganized core protein from preassembled capsids into noncapsid polymers, presumably by interaction of HAP with dimers freed during capsid ‘breathing’, the transitory breaking of individual intersubunit bonds. Bay 41-4109 was administered to HBV infected transgenic mouse or humanized mouse models and demonstrated in vivo efficacy with HBV DNA reduction (Deres K. et al. *Science* 2003, 893; Brezillon N. et al. *PLoS ONE* 2011, e25096). It was also shown that bis-ANS, a small molecule that acts as a molecular ‘wedge’ and interferes with normal capsid-protein geometry and capsid formation (Zlotnick A. et al. *J. Virol.* 2002, 4848-4854).

Compound of interest I can be prepared according to Scheme 1. A one-pot reaction between acetyl acetate II, benzaldehyde III and thiazole amidine IV gives dihydropyrimidine V. (-)-Enantiomer Va is then obtained by SFC chiral separation of V and its stereochemistry is determined by comparing its SFC retention time with one of its particular Compound B1 which stereochemistry is determined by X-ray diffraction study (FIG. 1). Bromination of Va affords VI. Coupling VI with a suitable fused amine VII gives the compound of interest I.

Dihydropyrimidine V can be prepared from condensation and cyclization sequence of acetyl acetate II, aldehyde III and thiazole amidine IV. The reaction can be carried out in a suitable alcoholic solvent such as trifluoroethanol in the presence of a base such as potassium acetate under a heating condition over several hours.

(-)-Enantiomer Va is obtained by SFC chiral separation of V.

Bromide VI can be prepared by reaction of Va with a bromination reagent such as N-bromosuccinimide, in a suitable inert solvent such as carbon tetrachloride at 80-100 degrees Celsius.

Compound of interest I can be obtained by coupling bromide VI with a fused amine VII. The reaction is typically performed in a suitable solvent such as 1,2-dichloroethane at room temperature over several hours in the presence of an organic base such as N,N-diisopropylethylamine.

38

General synthetic route for the diastereoisomer mixture of compound I-I (Scheme 1-1)

Compound of interest I-I can be prepared in analogy to compound of interest I without SFC chiral separation of dihydropyrimidine V.

For scheme 1 or scheme 1-1, the 2-thiazolyl group of general formula (I), (V), (Va), (Vb), (VI), (VI-I), (I-I) and any other compounds of this invention can be further substituted by C₁₋₆alkyl, such as methyl.

This invention also relates to a process for the preparation of a compound of formula (I) or other compounds of the present invention comprising the reaction of

39

(a) a compound of formula (A)

with

in the presence of a base;
wherein R¹ to R⁶, X, Y, W and n are defined above unless otherwise indicated.

In step (a), the base can be for example N,N-diisopropylethylamine.

A compound of formula (I) or other compounds of the present invention when manufactured according to the above process is also an object of the invention.

Pharmaceutical Compositions and Administration

The invention also relates to a compound of formula (I) or other compounds of the present invention for use as therapeutically active substance.

Another embodiment provides pharmaceutical compositions or medicaments containing the compounds of the invention and a therapeutically inert carrier, diluent or excipient, as well as methods of using the compounds of the invention to prepare such compositions and medicaments. In one example, compounds of formula (I) or other compounds of the present invention may be formulated by mixing at ambient temperature at the appropriate pH, and at the desired degree of purity, with physiologically acceptable carriers, i.e., carriers that are non-toxic to recipients at the dosages and concentrations employed into a galenic administration form. The pH of the formulation depends mainly on the particular use and the concentration of compound, but preferably ranges anywhere from about 3 to about 8. In one example, a compound of formula (I) or a compound of the present invention is formulated in an acetate buffer, at pH 5. In another embodiment, the compounds of formula (I) and other compounds of the present invention are sterile. The compound may be stored, for example, as a solid or amorphous composition, as a lyophilized formulation or as an aqueous solution.

Compositions are formulated, dosed, and administered in a fashion consistent with good medical practice. Factors for consideration in this context include the particular disorder being treated, the particular human being treated, the clinical

40

condition of the individual patient, the cause of the disorder, the site of delivery of the agent, the method of administration, the scheduling of administration, and other factors known to medical practitioners. The "effective amount" of the compound to be administered will be governed by such considerations, and is the minimum amount necessary to the suppression of serum HBV DNA levels, or HBeAg seroconversion to HBeAb, or HBsAg loss, or normalization of alanine aminotransferase levels and improvement in liver histology. For example, such amount may be below the amount that is toxic to normal cells, or the human as a whole.

In one example, the pharmaceutically effective amount of the compound of the invention administered parenterally per dose will be in the range of about 0.01 to 100 mg/kg, alternatively about 0.1 to 20 mg/kg of patient body weight per day, with the typical initial range of compound used being 0.3 to 15 mg/kg/day. In another embodiment, oral unit dosage forms, such as tablets and capsules, contain from about 0.1 to about 1000 mg of the compound of the invention.

The compounds of the invention may be administered by any suitable means, including oral, topical (including buccal and sublingual), rectal, vaginal, transdermal, parenteral, subcutaneous, intraperitoneal, intrapulmonary, intradermal, intrathecal and epidural and intranasal, and, if desired for local treatment, intralesional administration. Parenteral infusions include intramuscular, intravenous, intraarterial, intraperitoneal, or subcutaneous administration.

The compounds of the present invention may be administered in any convenient administrative form, e.g., tablets, powders, capsules, solutions, dispersions, suspensions, syrups, sprays, suppositories, gels, emulsions, patches, etc. Such compositions may contain components conventional in pharmaceutical preparations, e.g., diluents, carriers, pH modifiers, sweeteners, bulking agents, and further active agents.

A typical formulation is prepared by mixing a compound of the present invention and a carrier or excipient. Suitable carriers and excipients are well known to those skilled in the art and are described in detail in, e.g., Ansel, Howard C., et al., *Ansel's Pharmaceutical Dosage Forms and Drug Delivery Systems*. Philadelphia: Lippincott, Williams & Wilkins, 2004; Gennaro, Alfonso R., et al. *Remington: The Science and Practice of Pharmacy*. Philadelphia: Lippincott, Williams & Wilkins, 2000; and Rowe, Raymond C. *Handbook of Pharmaceutical Excipients*. Chicago, Pharmaceutical Press, 2005. The formulations may also include one or more buffers, stabilizing agents, surfactants, wetting agents, lubricating agents, emulsifiers, suspending agents, preservatives, antioxidants, opaquing agents, glidants, processing aids, colorants, sweeteners, perfuming agents, flavoring agents, diluents and other known additives to provide an elegant presentation of the drug (i.e., a compound of the present invention or pharmaceutical composition thereof) or aid in the manufacturing of the pharmaceutical product (i.e., medicament).

An example of a suitable oral dosage form is a tablet containing about 0.1 mg to 1000 mg of the compound of the invention compounded with about 30 mg to 90 mg anhydrous lactose, about 5 mg to 40 mg sodium croscarmellose, about 5 mg to 30 mg polyvinylpyrrolidone (PVP) K30, and about 1 mg to 10 mg magnesium stearate. The powdered ingredients are first mixed together and then mixed with a solution of the PVP. The resulting composition can be dried, granulated, mixed with the magnesium stearate and compressed to tablet form using conventional equipment. An example of an aerosol formulation can be prepared by

dissolving the compound, for example 5 mg to 400 mg, of the invention in a suitable buffer solution, e.g. a phosphate buffer, adding a tonicifier, e.g. a salt such sodium chloride, if desired. The solution may be filtered, e.g., using a 0.2 micron filter, to remove impurities and contaminants.

An embodiment, therefore, includes a pharmaceutical composition comprising a compound of formula (I), or a stereoisomer or pharmaceutically acceptable salt thereof. In a further embodiment includes a pharmaceutical composition comprising a compound of formula (I), or a stereoisomer or pharmaceutically acceptable salt thereof, together with a pharmaceutically acceptable carrier or excipient.

To a stirred solution of thiazole-2-carbonitrile (1.5 g, 14 mmol) in 5 mL of dry MeOH was added dropwise a solution of sodium methoxide (0.74 g, 14 mmol) in 10 mL of dry methanol. The reaction mixture was stirred at room temperature until the disappearance of starting material. After that, ammonium chloride (1.5 g, 28 mmol) was added in one portion and the reaction mixture was stirred overnight. The undissolved material was removed by filtration and the filtrate was concentrated to afford thiazole-2-carboxamide hydrochloride (Compound A) as a grey solid which was used directly in the next step without further purification. MS: calc'd 128 (MH⁺), measured 128 (MH⁺).

Preparation of Compound B:

To a stirred solution of thiazole-2-carboxamide hydrochloride (0.13 g, 1.0 mmol), methyl acetoacetate (0.12 g, 1.0 mmol) and 2-chloro-4-fluorobenzaldehyde (0.16 g, 1.0 mmol) in trifluoroethanol (8 mL) was added potassium acetate (0.20 g, 2.0 mmol). The reaction mixture was refluxed for 16 hours. After it was cooled to room temperature, the reaction mixture was concentrated and the residue was dissolved in ethyl acetate and then washed with brine. The organic layer was dried over sodium sulfate. The solvent was concentrated, and the residue was purified by column chromatography (ethyl acetate/petroleum ether is from 1/4 to 1/2) to afford 4-(2-chloro-4-fluoro-phenyl)-6-methyl-2-thiazol-2-yl-1,4-dihydro-pyrimidine-5-carboxylic acid methyl ester (Compound B) as a yellow solid. MS: calc'd (MH⁺) 366, measured (MH⁺) 366.

Preparation of Compound B1:

The enantiomer (R)-4-(2-chloro-4-fluoro-phenyl)-6-methyl-2-thiazol-2-yl-1,4-dihydro-pyrimidine-5-carboxylic acid methyl ester (Compound B1) was obtained through SFC (SFC-Multigram; IC: 5×250 mm, 5μ) chiral separation of 4-(2-chloro-4-fluoro-phenyl)-6-methyl-2-oxazol-2-yl-1,4-dihydro-pyrimidine-5-carboxylic acid methyl ester (Compound B) eluting with a mixed solvent of 85% supercritical CO₂/15% EtOH at 100 mL/min rate. The desired (-)-enantiomer B1 was eluted out before (+)-enantiomer B2. The absolute configuration of (-)-enantiomer B1 was determined by X-ray diffraction study (FIG. 1).

Compound B1: $[\alpha]_D^{20} -55.0$ (c 0.845, MeOH).

Compound B2: $[\alpha]_D^{20} +44.6$ (c 0.175, MeOH).

Preparation of Compound C:

To a stirred solution of (R)-4-(2-chloro-4-fluoro-phenyl)-6-methyl-2-thiazol-2-yl-1,4-dihydro-pyrimidine-5-carboxylic acid methyl ester (0.37 g, 1.0 mmol) in CCl₄ (5 mL) was

added NBS (0.20 g, 1.1 mmol) in portions. After the reaction mixture was stirred at room temperature for 1 hour, the solvent was removed in vacuo and the residue was purified by column chromatography to give (R)-6-bromomethyl-4-(2-chloro-4-fluoro-phenyl)-2-thiazol-2-yl-1,4-dihydro-pyrimidine-5-carboxylic acid methyl ester (Compound C) as a yellow solid. MS: calc'd 445 (MH⁺), measured 445 (MH⁺).

Preparation of hexahydro-pyrazino[1,2-c][1,3]oxazin-6-one (Compound D)

Step 1:

Methyl 4-boc-piperazine-2-acetate (CAS number: 183742-33-8, Chemfinder) (1.0 g, 4 mmol) was dissolved in 10 mL of MeOH, then NaBH₄ (1.5 g, 40 mmol) was added portion wise and stirred overnight. The solvent was removed in vacuo and the residue was partitioned between EtOAc and water. The organic layer was separated, and then dried over Na₂SO₄ and concentrated to give 3-(2-hydroxy-ethyl)-piperazine-1-carboxylic acid tert-butyl ester as crude oil (compound E), which was used directly without further purification.

49

Step 2:

3-(2-Hydroxy-ethyl)-piperazine-1-carboxylic acid tert-butyl ester (58 mg, 0.25 mmol) was dissolved in 4 mL of dichloromethane and 1 mL of DIPEA, and then triphosgene (27 mg, 0.09 mmol) was added at room temperature. The reaction mixture was stirred for 30 minutes, and the solvent was removed in vacuo. The residue was dissolved in 3 mL of dichloromethane and 1 mL of TFA. After the reaction mixture was stirred for 1 hour, the solvent was removed in vacuo to give hexahydro-pyrazino[1,2-c][1,3]oxazin-6-one trifluoro acetic acid salt (Compound D) as a crude product which was used directly without further purification. LC/MS: calc'd 157 (MH⁺), exp 157 (MH⁺).

The reaction mixture was stirred at room temperature until the disappearance of starting material. The mixture was diluted with EtOAc (50 mL) and washed successively with saturated aqueous NH₄Cl solution and brine. The organic layer was separated and then dried over Na₂SO₄. The solvent was concentrated in vacuo and the crude product was purified by prep-HPLC to give methyl (4R)-4-(2-chloro-4-fluoro-phenyl)-6-[(6-oxo-1,3,4,8,9,9a-hexahydropyrazino[1,2-c][1,3]oxazin-2-yl)methyl]-2-thiazol-2-yl-1,4-dihydropyrimidine-5-carboxylate (Example 1) as a light yellow solid (11 mg). ¹H NMR (400 MHz, METHANOL-d₄) δ ppm 7.97 (dd, J=3.01, 1.00 Hz, 1H), 7.81 (d, J=3.01 Hz, 1H), 7.46 (dd, J=8.66, 6.15 Hz, 1H), 7.26 (dd, J=8.78, 2.51 Hz, 1H), 7.00-7.13 (m, 1H), 6.19 (d, J=1.76 Hz, 1H), 4.19-4.48 (m, 4H), 4.11 (d, J=16.06 Hz, 1H), 3.76-3.94 (m, 1H), 3.62 (s, 3H), 3.18-3.31 (m, 2H), 2.37-2.80 (m, 3H), 2.11-2.30 (m, 1H), 1.90 (qdd, J=14.37, 14.37, 9.22, 5.40 Hz, 1H). Preparation of (8aS)-2,5,6,7,8,8a-hexahydro-1H-imidazo[1,5-a]pyrazin-3-one (Compound H)

59

Step 1:

To a stirred solution of Na_2CO_3 (118 g, 1.11 mol) in water (600 mL) was added (2S)-piperazine-2-carboxylic acid dihydrochloride salts (30 g, 0.15 mol) at 25° C., followed by di-tert-butyl dicarbonate (112 g, 0.56 mol) and tetrahydrofuran (300 mL). Then the mixture was stirred for additional 20 hours at room temperature. The reaction mixture was concentrated in vacuo and the resulting solution was extracted with methyl tert-butyl ether (200 mL) three times to remove nonpolar species. The aqueous layer was cooled to below 0° C. and then treated with 3.0 M HCl until to pH 2 to 3. Then it was extracted with ethyl acetate (500 mL) three times. The combined organic layer was dried over Na_2SO_4 , and then filtered and concentrated under vacuum to give Compound I (39 g).

Step 2:

To a solution of Compound I (39 g, 0.12 mol) in tetrahydrofuran (200 mL) was added dropwise $\text{BH}_3 \cdot \text{THF}$ complex (240 mL, 0.24 mol) at 0° C. under N_2 atmosphere. Then the mixture was warmed to room temperature and heated to reflux for 2-3 hours. The mixture was quenched with MeOH (100 mL) at 0° C. and the obtained solution was concentrated in vacuo. The residue was re-dissolved into MeOH (200 mL) and the solution was refluxed for 3 to 4 hours. Then the solvent was removed to give the crude product (45 g). The crude product was purified by column chromatography on silica (petroleum ether/EtOAc=10:1 to 1:1) to give Compound J (31 g).

Then the mixture was stirred for additional 2 hours at 10° C. The mixture was quenched with 1N HCl (100 mL) and then extracted with EtOAc (300 mL). The organic layer was dried over Na_2SO_4 , filtered, and then concentrated in vacuo to give the crude product (50 g). The crude product was triturated with petroleum ether/EtOAc (200 mL, V/V=5:1) to get crude product (25 g) with removal of triphenylphosphine oxide and other impurities. The crude product was purified by column chromatography on silica (petroleum ether/EtOAc=20:1) to get the pure product K (12 g) as a white solid and some impure compound K (4 g).

60

Step 4:

To a stirred solution of Compound K (12 g, 26.9 mmol) in ethanol (85 mL) was added methylamine alcohol solution (85 mL) at room temperature. Then the mixture was heated to reflux for additional 3 hours. The mixture was cooled to room temperature and then concentrated. The resulting residue was dissolved in water (50 mL), then acidified to pH 3 with 1N HCl solution, and then extracted with methyl-tert-butyl ether (50 mL) three times. The pH was adjusted to 10 with solid NaOH and the mixture was extracted with ethyl acetate (150 mL) three times. The organic layer was dried and filtered and the solvent was removed under reduced pressure to give Compound L (6 g crude).

Step 5:

And then additional NaH (1.0 g, 25 mmol) was added into the mixture at room temperature. After the reaction mixture was refluxed for 1 hour, the reaction was quenched with ice-water (100 mL) and then extracted with EtOAc (300 mL). The organic layer was evaporated in vacuo to give the crude product (5 g). The crude product was purified by column chromatography on silica gel (EtOAc/MeOH=200:1) to give Compound M (2.2 g, 40%).

Step 6:

To a stirred solution of Compound M (2.2 g, 9.1 mmol) in 30 mL of dichloromethane was added dropwise 10 mL of TFA. After the reaction mixture was stirred for 1 hour, the solvent was removed in vacuo to give (8aS)-2,5,6,7,8,8a-hexahydro-1H-imidazo[1,5-a]pyrazin-3-one trifluoroacetic acid salt (Compound H) as a crude product which was used directly without further purification.

123

Step 1:

A mixture of 2,2-dimethylbutyrolactone (6.84 g, 60 mmol) and KOH (3.36 g) in H₂O (60 mL) was heated at reflux for 2 h. The solution was cooled to room temperature and acidified to pH 5 with aqueous HCl solution. The mixture was then extracted with ethyl acetate 3 times. The combined organic layers were washed with brine, dried over Na₂SO₄, concentrated under reduced pressure to give 4-hydroxy-2,2-dimethylbutanoic acid compound 54-B (4 g).

Step 2:

To the mixture of compound 54-B (2.2 g, 16.6 mmol) in ethyl ether (16 mL) and methanol (24 mL) at 0° C. was added a hexane solution (2.0 M) of trimethylsilyldiazomethane (12.5 mL, 25 mmol). The reaction mixture was stirred at 0° C. for 1 h. The solvent was evaporated and the residue was taken up in ethyl acetate, washed successively with diluted aqueous HCl solution, saturated NaHCO₃ solution and brine. The mixture was dried over Na₂SO₄ and concentrated to give 4-hydroxy-2,2-dimethylbutyric acid methyl ester compound 54-C (1.5 g).

Step 3:

To a solution of the alcohol 54-C (45 mg, 0.34 mmol) in THF (4 mL) at 0° C. were added Ph₃P (136 mg, 0.52 mmol), imidazole (71 mg, 1.04 mmol), and I₂ (132 mg, 0.52 mmol). After 1 h, the reaction mixture was quenched with saturated

124

Na₂S₂O₃ solution. The aqueous layer was extracted twice with hexanes. The organic layer were dried over Na₂SO₄ and concentrated under vacuum to give compound 54-D as a crude product.

Step 4:

To a stirred solution of compound M (256 mg, 1 mmol) in DMF (2 mL) was added NaH (48 mg, 2 mmol) at room temperature. The reaction mixture was stirred 20 min at room temperature, then compound 54-D (256 mg, 1 mmol) was added. After the reaction mixture was stirred for 4 hours at room temperature, EA was added and the mixture was washed with water and brine. The mixture was dried over Na₂SO₄, and concentrated under reduced pressure to give the crude product, which was purified by column to give compound 54-E (150 mg).

Step 5:

To a stirred solution of compound 54-E (150 mg, 0.4 mmol) in THF (5 mL) and water (2 mL) was added LiOH (96 mg 2.4 mmol). After the reaction mixture was stirred at 80° C. for 18 h, it was concentrated under reduced pressure to give the crude product, which was dissolved in DCM (4 mL) and treated with TFA (4 mL). The mixture was stirred for 2 hours at room temperature, then it was concentrated under reduced pressure to give the crude product 54-A which was used directly.

186

-continued

65 Step 1:

The mixture of compound AV (6.5 g, 16.7 mmol) and borane-THF complex solution 1.0 M in THF (40 mL, 40

187

mmol) was stirred at 32° C. overnight. The reaction mixture was concentrated. The residue was dissolved in ethyl acetate (60 mL) and added 2.0 mL of hydrogen chloride solution (4.0 M in dioxane). The mixture was extracted with ethyl acetate (50 mL) three times. The combined organic phase was dried over Na₂SO₄, filtrated and concentrated. The residue was purified by column to give compound 82-C-1 (4.0 g).

Step 2:

To a solution of oxalyl chloride (2.0 mL) in dry dichloromethane (60 mL) under nitrogen at -78° C. was added dropwise of dimethyl sulfoxide (3.3 mL, 47 mmol) in dry dichloromethane (2.0 mL). After addition, the reaction mixture was stirred for 1 hour at -78° C. Then to the reaction mixture was added compound 82-C-1 (4.0 g, 10.7 mmol) in dry dichloromethane (6.0 mL) dropwise and stirred for another hour at -78° C. The reaction was quenched by adding triethylamine (12 mL, 86 mmol) dropwise over 30 minutes. The resulting mixture was warmed up to room temperature, and the organic phase was washed by ice-water, separated and dried over Na₂SO₄, then filtrated and concentrated to give crude compound 82-C-2 (3.72 g, crude), which was used directly.

Step 3:

To a solution of compound 82-C-2 (930 mg, 2.5 mmol) in dichloromethane (10 mL) was added cyclopropylamine (260 μL, 3.75 mmol), catalytic amount of acetic acid (2 drops) and sodium triacetoxyborohydride (1.06 g, 5 mmol). The reaction mixture was stirred at room temperature overnight. The reaction was quenched by adding ice-water, extracted with dichloromethane (30 mL) two times and the organic phase was washed with sodium bicarbonate solution and dried over Na₂SO₄, then filtrated and concentrated to give crude compound 82-C-3 (1.03 g, crude).

Step 4:

The mixture of compound 82-C-3 (1.03 g, 2.5 mmol) in dichloromethane (15 mL) was added diisopropylethylamine (1.0 mL) and 4-nitrophenyl chloroformate (1.0 g, 5.0 mmol). The reaction mixture was stirred at 40° C. for 2 hours. The reaction was quenched by adding ice-water and extracted with dichloromethane (30 mL) two times. The organic phase was washed with sodium bicarbonate solution and dried over Na₂SO₄, then filtrated and concentrated. The residue was purified by column to give compound 82-C-4 (1.4 g).

Step 5:

The mixture of compound 82-C-4 (1.4 g, 2.42 mmol) and TFA/DCM=2/1 (6 mL) was stirred at room temperature for 30 minutes. The reaction mixture was concentrated and added toluene for co-evaporation to remove trifluoroacetic acid. The residue was dissolved in dichloromethane (15 mL), and then diisopropylethylamine (2 mL) was added. The reaction mixture was heated to 40° C. overnight. To the reaction mixture was added di-tert-butyl dicarbonate (1.1 g, 5.0 mmol) and stirred for another 5 hours. The reaction mixture was quenched by adding ice-water, extracted with ethyl acetate (30 mL) two times. The organic phase was separated, dried over Na₂SO₄, filtrated and concentrated. The residue was purified by column to give compound 82-C-5 (680 mg).

188

Step 6:

The mixture of compound 82-C-5 (170 mg, 0.5 mmol) and TFA/DCM=2/1 (3 mL) was stirred at room temperature for 30 minutes. The reaction mixture was concentrated and added toluene for co-evaporation to remove trifluoroacetic acid to give crude compound 82-C which was used directly.

Step I:

To a stirred solution of compound 82-C-1 (8.6 g, 23 mmol) and pyridine (3.64 g, 46 mmol) in DCM (80 mL) was added a solution of (4-nitrophenyl) carbonochloridate (6.95 g, 34.5 mmol) in DCM (20 mL) at 0° C. Compound 105-C-1 was prepared in analogy to Compound 67-D by using 1-amino-2-methyl-propan-2-ol instead of 2-aminoethanol.

Example 107: HBV Inhibition Assays

Cells and Culture Conditions:

HepG2.2.15 and HepDE19 are stably-transfected cell lines containing the HBV genome. Both cell lines are derived from the hepatoblastoma cell line Hep G2 (American Type Culture Collection, ATCC® HB-8065™) by the published procedures described in references: MA Selles et al. Proc. Natl. Acad. Sci. USA 1987, 84, 1005-1009 and H Guo et al. Journal of Virology 2007, 81, 12472-12484, respectively. Both cell lines were maintained in Dulbecco's modified Eagle's medium (DMEM)-F12 medium supplemented with 10% fetal bovine serum, 100 U/mL penicillin, 100 µg/mL streptomycin, and 0.5 mg/mL of G418.

While HepG2.2.15 cells constitutively support HBV replication and production of virus particles, HepDE19 cells are inducible by tetracycline. Addition of 1 µg/mL tetracycline in culture medium suppresses HBV replication in HepDE19 cells, whereas switching to tetracycline-free medium resumes this process.

Anti-HBV Activity In Vitro:

HepG2.2.15 cells were seeded into 96-well plates (3×10⁴ cells in 100 µL media per well) and incubated overnight at 37° C. The test compounds were serially half-log diluted in DMSO, then diluted 100 times in culture media. 100 µL of diluted compounds were added into the plates to reach 0.5% final concentration of DMSO in every well. Five days after compound treatment, culture supernatant was collected for further analysis.

261

For quantitative PCR detection of extracellular HBV DNA, 100 μ L of culture supernatant was collected and processed in MagNA Pure 96 Nucleic Acid Purification System (Roche Applied Science) for viral DNA extraction. The extracted samples were subjected to HBV DNA quantification by qPCR. The effective compound concentration at which HBV replication is inhibited by 50% (EC_{50}) was determined as shown in Table 1.

The compounds of the present invention were tested for their capacity to inhibit a HBV activity and activation as described herein. The Examples were tested in the above assays as described herein and found to have $EC_{50} < 0.2 \mu$ M in HepG2.2.15 assay. Particular compounds of formula (I) or other compounds of the present invention were found to have $EC_{50} < 0.02 \mu$ M in HepG2.2.15 assay.

Cytotoxicity and Selectivity Index:

HepDE19 cells were seeded into 96-well plates (5×10^3 cells per well) and treated with compounds for EC_{50} determination. Five days after treatment, cell viability was measured by addition of 20 μ L of CCK-8 reagent. Two hours after incubation at 37° C., the absorbance at wavelengths of 450 nm and 630 nm (OD_{450} and OD_{630}) was recorded by a plate reader. The concentration results in the death of 50% of the host cells (CC_{50}) of each compound were determined.

The relative effectiveness of the compound in inhibiting viral replication compared to inducing cell death was defined as the selectivity index (CC_{50} value/ EC_{50} value). Based on CC_{50} and EC_{50} data, selectivity indexes were determined.

Results of CC_{50} and the corresponding selectivity index are given in Table 2.

Example 108: Human Microsomal Metabolic Stability

Human Microsomes (BD Gentest) were preincubated with test compound for 10 minutes at 37° C. in 100 mM phosphate buffer, pH 7.4. The reactions were initiated by adding NADPH or NADPH regenerating system to give a final incubation volume of 400 μ L. For NADPH system, the final incubations contained 1 μ M test compound, 0.5 mg/mL liver microsomal protein, 1 mM NADPH in 100 mM phosphate buffer, pH 7.4. For the NADPH regenerating system, the final incubations contained 1 μ M test compound, 0.5 mg/mL liver microsomal protein, 3 mM glucose 6-phosphate, 1 mM NADP, 3 mM $MgCl_2$ and 0.05 mg/mL glucose 6-phosphate dehydrogenase in 100 mM phosphate buffer, pH 7.4. After incubation times of 0, 3, 6, 9, 15 and 30 minutes at 37° C., 1 sample was obtained from each time point and 50 μ L of each sample was removed and transferred to 150 μ L of methanol solution which was maintained at 4° C. and contained 2 μ M tolbutamide as internal standard.

263

Following precipitation and centrifugation, the amount of compound remaining in the samples were determined by LC-MS/MS. Controls of no NADPH or no NADPH regenerating system at zero and 30 minutes were also prepared and analyzed.

Results of metabolic stability study in human microsome are given in Table 3.

Example 109: Lysa Solubility

Samples were prepared in duplicate from 10 mM DMSO stock solutions. After evaporation of DMSO with a centrifugal vacuum evaporator, the residue was solved in 0.05 M phosphate buffer (pH 6.5), stirred for one hour and shook for two hours. After one night, the solution was filtered using a microtiter filter plate. Then the filtrate and its 1/10 dilution were analyzed by direct UV measurement or by HPLC-UV. In addition a four-point calibration curve was prepared from the 10 mM stock solutions and used for the solubility determination of the compounds. The results were in $\mu\text{g/mL}$. In case the percentage of sample measured in solution after evaporation divided by the calculated maximum of sample amount was over 80%, the solubility was reported as higher than this value.

Example 110: Cytochrome P450 (Cyp450) Induction Screening Assay__ mRNA Induction

Materials

Cell Culture

Human cryopreserved hepatocytes (Life Technologies, Carlsbad, USA) were thawed and cultured in collagen I coated 96-well plates with a density of 52,000 cells/well. After attachment, medium was changed and cells were pre-cultured overnight in hepatocyte maintenance medium (HMM; Lonza, Switzerland).

Test compounds were dosed to the cells next morning at an indicated concentration (up to 10 μM) in HMM culture media containing gentamycin and a constant 0.1% DMSO. Similarly, dilutions of the positive inducer compounds omeprazole (prototypical inducer of human CYP1A2; final concentrations: 1 and 10 μM), phenobarbital (prototypical inducer of human CYP2B6; final concentrations: 100 and 1000 μM) and rifampicin (prototypical inducer of human CYP3A4; final concentrations: 1 and 10 μM) were prepared from 1000 fold DMSO stock solutions in HMM containing gentamycin. Medium change was then performed and cells were exposed for 24 hours to test compounds, positive inducer compounds, or vehicle (0.1% DMSO), respectively.

At the end of the compound exposure period, medium was removed and cells lysed using 100 μL /well MagNA Pure LC RNA isolation tissue lysis buffer (Roche Diagnostics AG, Rotkreuz, Switzerland). Plates were then sealed and frozen at -80°C . until further workup.

mRNA Isolation, Processing and qRT-PCR

mRNA isolation was performed using the MagNA Pure 96 system (Roche Diagnostics AG, Rotkreuz, Switzerland) and the respective cellular RNA large volume kit (Roche

265

Diagnostics AG, Rotkreuz, Switzerland) from thawed samples diluted 1:1 with PBS. The volume of the cell lysis and an elution volume of 100 μ L were used. 20 μ L of the resulting mRNA suspension was then used for reverse transcription using 20 μ L of the transcript or first stand cDNA synthesis kit (Roche prime Supply, Mannheim, Germany). The resulting cDNA was diluted with 40 μ L of H₂O before using for qRT-PCR. qRT-PCR was performed by using the forward and the reverse primer, the corresponding UPL (all from Microsynth, Balgach, Switzerland) and the Taqman Fast advanced master mix (Applied Biosystems), on an ABI 7900 machine (Applied Biosystems).

Calculations

qRT-PCR Ct-values for the respective P450s were put into relation to the Ct-value of RN18S1 (microsynth, Balgach, Switzerland) of the same sample. Doing so, a respective Δ ct-value was calculated. Using the average of all Δ ct-values for the vehicle control samples, a $\Delta\Delta$ ct-value was calculated for each sample ($\Delta\Delta$ ct-value(sample)= Δ ct-value(sample)-average of Δ ct-value of all vehicle controls). The fold induction of the respective sample was calculated as $2^{(-\Delta\Delta$ ct)}. The individual fold induction values were then averaged per treatment condition (usually n=3 biological replicates).

Relative induction values to the respective positive inducer compound condition (10 μ M omeprazole for CYP1A2; 1000 μ M Phenobarbital for CYP2B6; 10 μ M rifampicin for CYP3A4) were then calculated from the fold induction values as follows:

$$\text{Relative induction (\%)} = 100 \times (T-V)/(P-V)$$

T: fold induction of test compound condition

P: fold induction of positive inducer compound

V: fold induction of vehicle controls

Results of CYP3A4 induction are given in Table 5.
