(57) **ABSTRACT**

A fiber optic enclosure assembly includes a housing having an interior region and a bearing mount disposed in the interior region of the housing. A cable spool is connectedly engaged with the bearing mount such that the cable spool selectively rotates within the housing. A termination module disposed on the cable spool so that the termination module rotates in unison with the cable spool. A method of paying out a fiber optic cable from a fiber optic enclosure includes rotating a cable spool, which has a subscriber cable coiled around a spooling portion of the cable spool, about an axis of a housing of the fiber optic enclosure until a desired length of subscriber cable is paid out. A termination module is disposed on the cable spool.

**30 Claims, 14 Drawing Sheets**

No. 7,894,701, which is a continuation of application Ser. No. 12/182,705, filed Jul. 30, 2008, now U.S. Pat. No. 7,756,379, which application claims the benefit of provisional application Ser. Nos. 61/029,248, filed Feb. 15, 2008 and 60/954,214, filed Aug. 6, 2007, which applications are incorporated herein by reference in their entirety.

### TECHNICAL FIELD

The present disclosure relates to fiber optic enclosure, and more particularly, to a fiber optic enclosure with cable payout.

### BACKGROUND

As demand for telecommunications increases, fiber optic networks are being extended in more and more areas. In facilities such as multiple dwelling units, apartments, condominiums, businesses, etc., fiber optic enclosures are used to provide a subscriber access point to the fiber optic network. These fiber optic enclosures are connected to the fiber optic network through subscriber cables connected to a network hub. However, the length of subscriber cable needed between the fiber optic enclosure and the network hub varies depending upon the location of the fiber optic enclosure with respect to the network hub. As a result, there is a need for a fiber optic enclosure that can effectively manage varying lengths of subscriber cable.

### SUMMARY

An aspect of the present disclosure relates to a fiber optic enclosure assembly for enclosing optical fiber connections. The fiber optic enclosure assembly includes a housing having an interior region and a bearing mount disposed in the interior region of the housing. A cable spool is connectively engaged with the bearing mount such that the cable spool selectively rotates within the housing. A termination module is disposed on the cable spool so that the termination module rotates in unison with the cable spool.

Another aspect of the present disclosure relates to a method of paying out a fiber optic cable from a fiber optic enclosure. The method includes rotating a cable spool, which has a subscriber cable coiled around a spooling portion of the cable spool, about an axis of a housing of the fiber optic enclosure until a desired length of subscriber

cable is paid out. The cable spool is disposed in an interior region of the fiber optic enclosure and a termination module is disposed on the cable spool.

A variety of additional aspects will be set forth in the description that follows. These aspects can relate to individual features and to combinations of features. It is to be understood that both the foregoing general description and the following detailed description are exemplary and explanatory only and are not restrictive of the broad concepts upon which the embodiments disclosed herein are based.

### DESCRIPTION OF THE DRAWINGS

FIG. 1 is a schematic representation of a fiber optic network that includes a fiber optic enclosure having features that are examples of inventive aspects in accordance with the principles of the present disclosure.

FIG. 2 is an isometric view of the fiber optic enclosure of FIG. 1.

FIG. 3 is an isometric view of the fiber optic enclosure of FIG. 2 with a cover in an open position.

FIG. 4 is a front view of the fiber optic enclosure of FIG. 2 with the cover in the open position.

FIG. 5 is an exploded isometric view of the fiber optic enclosure of FIG. 2.

FIG. 6 is a perspective view of a fiber optic adapter suitable for use within the fiber optic enclosure of FIG. 2.

FIG. 7 is a cross-sectional view of the fiber optic adapter taken on line 7-7 of FIG. 6.

FIG. 8 is an isometric view of another embodiment of a fiber optic enclosure.

FIG. 9 is a front view of the fiber optic enclosure of FIG. 8.

FIG. 10 is a top view of the fiber optic enclosure of FIG. 8.

FIG. 11 is a side view of the fiber optic enclosure of FIG. 8.

FIG. 12 is an isometric view of the fiber optic enclosure of FIG. 8, showing cables entering and exiting the enclosure.

FIG. 13 is an isometric view of the fiber optic enclosure of FIG. 12 without the cover.

FIG. 14 is a front view of the fiber optic enclosure of FIG. 13.

FIG. 15 is an exploded isometric view of the fiber optic enclosure of FIG. 13.

FIG. 16 is an isometric view of the cable spool of the fiber optic enclosure of FIG. 13.

FIG. 17 is a further isometric view of the fiber optic enclosure of FIG. 12, with the cover in the pivoted open position.

FIG. 18 is an exploded view of a shipping container in which is disposed the fiber optic enclosure of FIG. 8.

### DETAILED DESCRIPTION

Reference will now be made in detail to the exemplary aspects of the present disclosure that are illustrated in the accompanying drawings. Wherever possible, the same reference numbers will be used throughout the drawings to refer to the same or like structure.

Referring now to FIG. 1, a schematic representation of a fiber optic network, generally designated **11**, in a facility **13** (e.g. individual residence, apartment, condominium, business, etc.) is shown. The fiber optic network **11** includes a feeder cable **15** from a central office (not shown). The feeder cable **15** enters a feeder cable input location **17** (e.g., a fiber

distribution hub, a network interface device, etc.) having one or more optical splitters (e.g., 1-to-8 splitters, 1-to-16 splitters, or 1-to-32 splitters) that generate a number of individual fibers. In the subject embodiment, and by way of example only, the fiber distribution hub 17 is located on a lower level 19 of the facility 13. Each unit in the facility 13 includes a fiber optic enclosure, generally designated 21, with a subscriber cable 22 extending from each of the fiber optic enclosures 21 to the fiber distribution hub 17. The subscriber cable 22 extending between the fiber distribution hub 17 and the fiber optic enclosure 21 typically includes multiple optical fibers.

Referring now to FIGS. 2-5, the fiber optic enclosure 21 will now be described. The fiber optic enclosure 21 includes a housing, generally designated 23, having a cover 25.

The housing 23 includes a base 27, a first sidewall 29, and an oppositely disposed second sidewall 31. The first and second sidewalls 29, 31 extend outwardly from the base 27 such that the base 27 and the first and second sidewalls 29, 31 cooperatively define an interior region 33. In the subject embodiment, the cover 25 is hingedly engaged with a sidewall 35 that is connected to the base 27 and the first and second sidewalls 29, 31. It will be understood, however, that the scope of the present disclosure is not limited to the cover 25 being hingedly engaged the sidewall 35.

A cable spool, generally designated 37, is disposed in the interior region 33 of the fiber optic enclosure 21. The cable spool 37 includes a spooling portion 39, around which subscriber cable 22 is coiled (shown schematically in FIG. 1). The cable spool 37 further includes an axial end 41.

In the subject embodiment, the axial end 41 of the cable spool 37 defines a termination area 43 (shown as a dashed line in FIG. 5). Disposed in the termination area 43 is a termination module, generally designated 45. The termination module 45 of the fiber optic enclosure 21 serves as the dividing line between the incoming fibers and the outgoing fibers.

In the subject embodiment, the termination module 45 includes an adapter plate 47. The adapter plate 47 is an L-shaped bracket having a first side 49 (shown in FIG. 4) and a second side 51. The first side 49 defines a plurality of mounting holes 53 while the second side 51 defines an adapter slot 55. It will be understood, however, that the scope of the present disclosure is not limited to the adapter plate 47 being an L-shaped bracket. The first side 49 of the adapter plate 47 is rigidly mounted (i.e., non-rotatable) to the axial end 41 of the cable spool 37 through a plurality of fasteners 57 (e.g., bolts, screws, rivets, etc.) which are inserted through the mounting holes 53 in the first side 49 and in connected engagement with the axial end 41 of the cable spool 37.

The adapter slot 55 in the second side 51 of the adapter plate 47 is adapted to receive a plurality of adapters, generally designated 401. In the subject embodiment, the adapters 401 are SC-type adapters 401, although it will be understood that the scope of the present disclosure is not limited to the use of SC-type adapters 401. Similar SC-type adapters 401 have been described in detail in commonly owned U.S. Pat. No. 5,317,663, the disclosure of which is incorporated herein by reference.

Referring now to FIGS. 6 and 7, the SC-type adapter 401 includes a main body 403 with a pair of tabs 405, 407 located on the exterior of the main body 403. The tabs 405, 407 serve to support the adapter 401 in the adapter slot 55. The adapter 401 further includes a pair of retaining clips 409, 411, with one retaining clip 409, 411 associated with each tab 405, 407. A front side 413 of the adapter 401 is

inserted into the adapter slot 55. As the adapter 401 is inserted through the adapter slot 55, the retaining clips 409, 411 compress against the main body 403. The adapter 401 is inserted into the adapter slot 55 until the tabs 405, 407 abut the adapter plate 47. With the tabs 405, 407 abutting the adapter plate 47, the retaining clips 409, 411 decompress on the opposite side of the adapter plate 47, thereby retaining the adapter plate 47 between the retaining clips 409, 411 and the tabs 405, 407.

In an alternate embodiment, the termination module includes a plurality of sliding adapter modules. Similar sliding adapter modules have been described in detail in commonly owned U.S. Pat. Nos. 5,497,444; 5,717,810, 6,591,051 and U.S. Pat. Pub. No. 2007/0025675, the disclosures of which are incorporated herein by reference.

Referring now to FIGS. 3-5, the axial end 41 of the cable spool 37 further defines a slack storage area 59. The slack storage area 59 includes a cable management spool 61 disposed on the axial end 41 of the cable spool 37. The cable management spool 61 is sized such that an outer radius of the cable management spool 61 is larger than the minimum bend radius of the optical fibers so as to avoid attenuation damage to the optical fibers during storage.

The cable management spool 61 and the axial end 41 of the cable spool 37 cooperatively define a cable passage 63 that extends axially through the cable management spool 61 and through the axial end 41 of the cable spool 37. The cable passage 63 allows connectorized ends of incoming optical fibers to pass from the spooling portion 39 of the cable spool 37 to the slack storage area 59. The connectorized ends of the incoming optical fibers are then routed from the slack storage area 59 to the front sides 413 of the adapters 401 in the termination area 43.

Referring now to FIG. 5, the fiber optic enclosure 21 further includes a bearing mount, generally designated 71. In the subject embodiment, the bearing mount 71 is disposed on the base 27 of the housing 23. An outer surface 73 of the bearing mount 71 is adapted for a bearing 75 (shown as cross-hatching). In the subject embodiment, the bearing 75 is a needle bearing. However, it will be understood that the scope of the present disclosure is not limited to the bearing 75 being a needle bearing as the bearing 75 could also include a bushing, low-friction coating, etc.

In one embodiment, the bearing 75 is engaged with an inner diameter of a central hole of the cable spool 37. In another embodiment, a rotary plain bearing is formed between the outer surface 73 of the bearing mount 71 and the inner diameter of the central hole of the cable spool 37. In this embodiment, the outer diameter of the bearing mount 71 is sized to fit within an inner diameter of a central hole of the spooling portion 39. The engagement of the bearing mount 71 and the spooling portion 39 of the cable spool 37 allows the cable spool 37 to rotate about the central axis 77 of the bearing mount 71.

Referring now to FIGS. 1 and 5, the subscriber cable 22, which includes multiple optical fibers, is coiled around the spooling portion 39 of the cable spool 37. In order to protect the subscriber cable 22 from attenuation resulting from the coiling of the subscriber cable 22 around the spooling portion 39, the cable spool 37 has an outer circumferential surface having a radius that is greater than the minimum bend radius of the subscriber cable 22. The subscriber cable 22 includes a first end having connectorized ends, which are inserted through the cable passage 63 and connectedly engaged with the first ends 413 of the adapters 401. A second end of the subscriber cable 22 is configured for connectivity with the fiber distribution hub 17. However, as shown in

5

FIG. 1, the length of subscriber cable 22 needed between each of the fiber optic enclosures 21 in the facility 13 and the fiber distribution hub 17 will vary depending upon the location of each fiber optic enclosure 21 with respect to the fiber distribution hub 17.

A method of installing and using the fiber optic enclosure 21 to account for the varying lengths of subscriber cable 22 needed between the fiber optic enclosure 21 and the fiber distribution hub 17 will now be described. The fiber optic enclosure 21 provides dual functionality by serving as a storage location for the subscriber cable 22 and by selectively paying out a desired length of the subscriber cable 22.

A first length of subscriber cable 22 is stored in the fiber optic enclosure 21 by coiling the length of subscriber cable 22 around the cable spool 37. The first length of subscriber cable 22 includes an installation length, which is sufficiently long to extend from the mounting location of the enclosure 28 to the fiber distribution hub 17, and an excess length, which is the length of subscriber cable 22 remaining on the cable spool 37 after the installation length has been paid out. In one embodiment, the first length is greater than or equal to about 100 feet. In another embodiment, the first length of subscriber cable 22 is greater than or equal to about 200 feet. In another embodiment, the first length of subscriber cable 22 is greater than or equal to about 300 feet. In another embodiment, the first length of subscriber cable 22 is greater than or equal to about 400 feet. In another embodiment, the first length of subscriber cable 22 is greater than or equal to about 500 feet. In another embodiment, the first length of subscriber cable 22 is in the range of about 100 to about 2,000 feet. In another embodiment, the first length of subscriber cable 22 is in the range of about 100 to about 1,500 feet. In another embodiment, the first length of subscriber cable 22 is in the range of about 500 to about 1,500 feet. In a preferred embodiment, the first length of subscriber cable 22, which is coiled around the cable spool 89, is in the range of 100 to 500 feet.

In one embodiment, a second length, or the excess length, of subscriber cable 22 is stored around the cable spool 37 after the first length of subscriber cable 22 has been paid out. If the first length of subscriber cable 22 is greater than the installation length of subscriber cable 22, the second length, or excess length, is stored around the cable spool 37.

The second function of the fiber optic enclosure 21 involves the selective payout of the subscriber cable 22. With the cable spool 37 mounted to the bearing mount 71, the first end of the subscriber cable 22 in connected engagement with the front sides 413 of the adapters 401 and the outgoing optical fibers disengaged from the back sides of the adapters 401, the subscriber cable 22 can be paid out through fiber ports 79 disposed in the first and second sidewalls 29, 31. The subscriber cable 22 is paid out of the fiber optic enclosure 21 by selectively rotating the cable spool 37 with respect to the housing 23 about the central axis 77 of the bearing mount 71. As the termination module 45 is disposed on the axial end 41 of the cable spool 37, the selective rotation of the cable spool 37 with respect to the housing 23 results in the selective rotation of the termination module 45. Since the termination module 45 rotates unitarily with or in unison with the cable spool 37, the second end of the subscriber cable 22 can be paid out without the first end of the subscriber cable 22 being pulled out of the termination module 45.

Once the desired length of subscriber cable 22 has been paid out, the rotation of the cable spool 37 is ceased. At this point, the position of the cable spool 37 can be fixed such that it does not rotate relative to the housing 23. In one

6

embodiment, a pin is inserted through an opening in the axial end 41 of the cable spool 37 and through a corresponding opening in the base 27 of the housing 23 to fix the position of the cable spool 37 with respect to the housing 23.

It will be understood, however, that the scope of the present disclosure is not limited to the use of a pin to fix the position of the cable spool 37 with respect to housing 23.

An alternate method of selectively paying-out subscriber cable 22 from the fiber optic enclosure 21 will now be described. With the fiber optic enclosure 21 positioned near the fiber distribution hub 17, the second end of the subscriber cable 22 is unwound from the cable spool 37. In one embodiment, the second end is optically connected to the fiber distribution hub 17. With the second end of the subscriber cable 22 optically connected to the fiber distribution hub 17 and the first end of the subscriber cable 22 in connected engagement with the termination module 45, the fiber optic enclosure 21 is transported away from the fiber distribution hub 17. In one embodiment, the fiber optic enclosure 21 is carried away from the fiber distribution hub 17 by an installer. In another embodiment, the fiber optic enclosure 21 is transported away from the fiber distribution hub 17 in a wheeled cart (e.g., dolly, 4-wheeled cart, etc.). In a preferred embodiment, the fiber optic enclosure is disposed in a packaging enclosure (e.g., a box) during transport. As the fiber optic enclosure 21 is transported away from the fiber distribution hub 17, the subscriber cable 22 unwinds from the cable spool 37 causing the cable spool 37 to rotate within the interior region 33 of the housing 23, which is disposed in the packaging enclosure. When the fiber optic enclosure 21 has been transported to its mounting location, the fiber optic enclosure 21 is removed from the packaging enclosure, mounted to the mounting location. The cable spool 37 can be fixed in position relative to the housing 23 to prevent inadvertent rotation of the cable spool 37.

Referring now to FIGS. 8-18, an alternate embodiment of a fiber optic enclosure 121 is shown. The fiber optic enclosure 121 includes a housing 123 and a hinged cover 125.

The housing 123 includes a base wall 120, a first sidewall 127 and an oppositely disposed second sidewall 128. The first and second sidewalls 127, 128 extend outwardly from the base wall 120 such that the base wall 120 and the first and second sidewalls 127, 128 cooperatively define an interior region 130.

In the subject embodiment, the first sidewall 127 of the housing 123 defines a first port 131 while the second sidewall 128 defines a second port 132. The subscriber cable 122 enters/exits the fiber optic enclosure 121 at the first port 131 or at the second port 132. In the subject embodiment, both of the first and second ports 131, 132 are provided as knockout portions.

A cable spool 137 is positioned within the interior region 130 of enclosure 121. In the subject embodiment, the cable spool 137 is adapted for rotation within the interior region 130 of the enclosure 121. In the subject embodiment, the cable spool 137 includes a first axial end 136, an oppositely disposed second axial end 138 and a spool portion 139. The spool portion 139 is disposed between the first and second axial ends 136, 138 of the cable spool 137. The spool portion 139 is adapted to receive a subscriber cable 122 coiled around or spooled on the spool portion 139.

With the subscriber cable 122 spooled on the spool portion 139, the subscriber cable 122 can be selectively paid out by rotating the cable spool 137. As the cable spool 137 is rotated, the subscriber cable 122 is unwound from the spool portion 139 of the cable spool 137. After a desired length of subscriber cable 122 has been paid out, pin

openings **141** can be used with a pin to fix the position of cable spool **137** relative to housing **123**.

The subscriber cable **122** is shown with a connectorized end **144** (e.g., MTP connector) for connecting to the fiber distribution hub **17** or other equipment. An opposite end of the subscriber cable **122** passes through an opening **145** disposed in the first axial end **136** of the cable spool **137**. After passing through the opening **145**, the subscriber cable **122** is routed to a fanout **147** disposed on the first axial end **136** of the cable spool **137** where the cable is broken out into individual fibers **124** having connectorized ends **146** (e.g., SC connectors).

A cable management spool **161** is also disposed on the first axial end **136** of the cable spool **137**. The cable management spool **161** manages fibers **124**. In the subject embodiment, the cable management spool **161** includes a plurality of fingers **162** disposed on an end of the cable management spool **161**. The fingers **162** assist with cable retention.

The first axial end **136** of the cable spool **137** further includes an outer guide wall **163**. In the subject embodiment, the outer guide wall **163** is disposed at a portion of the peripheral edge of the first axial end **136** adjacent to the cable management spool **161**. In the subject embodiment, the outer guide wall **163** extends outwardly in a direction that is generally perpendicular to the first axial end **136**.

The outer guide wall **163** includes with a cable finger **164** disposed at an end of the outer guide wall **163** that is opposite the end engaged with the first axial end **136** of the cable spool **137**. The cable finger **164** assists with retention and protection of the fibers **124**.

An adapter plate **149** is disposed on the first axial end **136** of the cable spool **137**. In the subject embodiment, the adapter plate **149** includes separate openings **151**. Each of the separate openings **151** is adapted to receive two adapters **401**.

In the depicted embodiment of FIG. 16, the cable management spool **161**, the outer guide wall **163** and the adapter plate **149** are integrally formed with the first axial end **136** of the cable spool **137**. In the subject embodiment, the first axial end **136** of the cable spool **137** is formed from plastic. In another embodiment, the first and second axial ends **136**, **138**, the spool portion **139**, the adapter plate **149**, the cable management spool **161** and the outer guide wall **163** are integrally formed from a plastic material.

Referring now to FIGS. 13 and 14, the fiber optic enclosure **121** is shown connected to a second subscriber cable **126**. After the subscriber cable **122** is paid out and cable spool **137** fixed in position relative to the housing **123**, individual connectorized ends of the second subscriber cables **126** can be connected to the fibers **124** at adapters **401** of adapter plate **149**. The second subscriber cables **126** exit the fiber optic enclosure **121** at a port **136** in a side **165** of the housing **123**. In the illustrated embodiment, a slotted foam member **138** is disposed in the port **136**. The slotted foam member **138** includes a plurality of slots through which the second subscriber cables **126** can be inserted in order to prevent or reduce the risk of ingress of environmental contamination (e.g., dust, water, etc.).

While the fiber optic enclosure **121** is shown mounted to a mounting location **183** (e.g., wall, pole, etc.) in FIGS. 1 and 17, it will be understood that the subscriber cable **122** can be paid out from the fiber optic enclosure **121** while the fiber optic enclosure **121** is either mounted to a mounting location **183** or removed from the mounting location **183**. As shown in FIG. 18, the subscriber cable **122** could be paid out while the fiber optic enclosure **121** is still packaged in a

shipping container **179** provided there is an opening **181** in the shipping container **179** through which the subscriber cable **122** can be pulled. After the subscriber cable **122** has been paid out, the fiber optic enclosure **121** can be removed from the shipping container **179** and mounted to the mounting location **183**.

Various modifications and alterations of this disclosure will become apparent to those skilled in the art without departing from the scope and spirit of this disclosure, and it should be understood that the inventive scope of this disclosure is not to be unduly limited to the illustrative embodiments set forth herein.

What is claimed is:

1. A telecommunications enclosure comprising:

- a wall mountable housing having a rear adapted to face toward a wall when the housing is mounted to the wall and an opposite front adapted to face away from the wall when the housing is mounted to the wall, the housing including a rear housing piece defining the rear of the housing and a front cover, the rear housing piece defining a front opening for allowing access to an interior of the rear housing piece, the front cover being movable relative to the rear housing piece between a first position and a second position, the front cover covering the front opening of the rear housing piece when in the first position such that access to the interior of the rear housing piece through the front opening is blocked by the front cover, the front cover not blocking the front opening when in the second position such that access to the interior of the rear housing piece through the front opening is permitted;
  - a spool disposed within the housing, the spool being rotatable relative to the housing about an axis of rotation that intersects the front cover when the front cover is in the first position;
  - a fiber optic cable coiled about a spooling portion of the spool, the fiber optic cable having a first end and a second end, the fiber optic cable including at least one optical fiber;
  - a fiber optic connector coupled to the optical fiber at the first end of the fiber optic cable;
  - the fiber optic cable being payable from the spool while the spool is positioned within the housing by pulling the second end of the fiber optic cable from the housing causing the spool to rotate relative to the housing about the axis of rotation as the fiber optic cable is paid out from the spool, wherein the fiber optic connector rotates in concert with the spool as the fiber optic cable is paid out from the spool;
  - a fiber optic adapter for coupling the fiber optic connector to a connectorized end of a subscriber cable, the fiber optic adapter being positioned at a first location within the housing;
  - the housing defining a cable opening for routing the subscriber cable into the housing, wherein a cabling region is provided within the housing for passing the subscriber cable from the cable opening to the first location; and
  - wherein the front cover blocks access to the fiber optic adapter and the cabling region from the front of the housing when in the first position, and wherein the fiber optic adapter and the cabling region are accessible from the front of the housing when the cover is in the second position.
2. The telecommunications enclosure of claim 1, wherein the front opening has a cross-dimension that is larger than an outer diameter of the spool, and wherein the front cover is

connected to the rear housing piece by a hinge such that the front cover pivots relative to the rear housing piece between the first and second positions.

3. The telecommunications enclosure of claim 1, wherein the fiber optic connector is supported on the spool when the fiber optic cable is paid out from the spool.

4. The telecommunications enclosure of claim 1, wherein the fiber optic adapter is coupled to the fiber optic connector, and wherein the fiber optic adapter rotates in concert with the spool as the fiber optic cable is paid out from the spool.

5. The telecommunications enclosure of claim 1, wherein the fiber optic cable includes a plurality of optical fibers, wherein a plurality of fiber optic connectors terminate the optical fibers at the first end of the fiber optic cable, wherein the fiber optic connectors rotate in concert with the spool as the fiber optic cable is paid out from the spool, wherein the telecommunications enclosure further includes a plurality of fiber optic adapters, and wherein the fiber optic connectors are secured within the plurality of fiber optic adapters when the fiber optic cable is paid out.

6. The telecommunications enclosure of claim 2, wherein the rear housing piece defines a plurality of rear fastener openings at the rear of the housing for use in securing the housing to the wall.

7. The telecommunications enclosure of claim 6, wherein the rear housing piece includes side walls that extend forwardly from the rear of the housing, and wherein the hinge is forwardly offset from the rear of the housing and is located at a forward end of one of the side walls.

8. The telecommunications enclosure of claim 1, wherein the rear housing piece includes forwardly projecting walls, and wherein the front cover is hingedly connected to a front end of one of the forwardly projecting walls of the rear housing piece by a hinge such that the hinge is forwardly offset from the rear of the housing, wherein the housing has a length that extends between first and second opposite ends of the housing and a width perpendicular to the length that extends between first and second opposite sides of the housing, and wherein the length is longer than the width.

9. The telecommunications enclosure of claim 8, wherein the hinge is located at the first end of the housing, wherein the cable opening is defined at the second end of the housing, wherein the spool is mounted closer to the first end than the second end, and wherein the cabling region extends between the spool and the second end of the housing.

10. The telecommunications enclosure of claim 8, wherein the hinge is located at the first side of the housing, wherein the cable opening is defined at the second end of the housing, and wherein a corner is defined between the first side of the housing and the second end of the housing.

11. The telecommunications enclosure of claim 8, wherein the cable opening is defined in part by the rear housing piece and in part by the front cover when the front cover is in the first position, wherein the rear housing piece includes a forwardly facing surface that defines a first portion of the cable opening and the front cover includes a rearwardly facing surface that defines a second portion of the cable opening when the front cover is in the first position.

12. The telecommunications enclosure of claim 1, wherein the housing has a length that extends between first and second opposite ends of the housing and a width perpendicular to the length that extends between first and second opposite sides of the housing, wherein the first and second sides of the housing extend between the first and second ends of the housing, wherein the length is longer than the width, wherein the cable opening is defined at the second

end of the housing, wherein the cabling region is defined within the housing between the spool and the second end of the housing.

13. The telecommunications enclosure of claim 12, wherein the rear housing piece includes a plurality of walls that extend forwardly from the rear of the housing and that at least partially define the first and second ends of the housing and the first and second sides of the housing, and wherein a hinge is forwardly offset from the rear of the housing and is located at a forward end of one of the plurality of walls.

14. The telecommunications enclosure of claim 1, wherein the cabling region extends at least partially across a front side of the spool so as to be defined between the front side of the spool and the front cover when the front cover is in the first position.

15. The telecommunications enclosure of claim 1, further comprising a cable manager within the housing for storing slack cable within the housing, the cable manager including a curved guide surface.

16. The telecommunications enclosure of claim 15, wherein the cable manager is a second spool located at a front face of the spool.

17. The telecommunications enclosure of claim 1, further comprising fastener pass-through locations defined by the rear housing piece at the rear of the housing.

18. The telecommunications enclosure of claim 17, wherein the fastener pass-through location includes fastener openings.

19. The telecommunications enclosure of claim 17, wherein the fastener pass-through locations are defined through a rear wall of the rear housing piece, wherein the fastener pass-through locations are offset from the spool such that the fastener pass-through locations are not blocked by the spool and can be accessed from the front of the housing when the front cover is in the second position, and wherein the front cover blocks access to the fastener pass-through locations from the front of the housing when the front cover is in the first position.

20. The telecommunications enclosure of claim 1, wherein a cable seal is provided at the cable opening.

21. A fiber optic enclosure comprising:

a housing including major sides and minor sides, the major sides defining a front and an opposite back, the minor sides extending between the front and back of the housing, the housing also including a cover movable between an open position and a closed position, the front of the housing being open when the cover is in the open position and being closed when the cover is in the closed position;

the housing defining a cable opening for routing a subscriber cable into the housing;

a spool mountable within the housing;

a fiber optic cable coiled about a spooling portion of the spool, the fiber optic cable including at least one optical fiber;

a fiber optic connector coupled to the optical fiber of the fiber optic cable;

a fiber optic adapter positioned within the housing, the fiber optic adapter including a first connector port for receiving the fiber optic connector and also including an opposite second connector port, the cover preventing the first and second connector ports of the fiber optic adapter from being accessed from the front of the housing when the cover is in the closed position, and the first and second connector ports of the fiber optic

**11**

adapter being accessible from the front of the housing when the cover is in the open position; the fiber optic cable being payable from the spool while the spool is positioned within the housing, wherein the spool rotates relative to the housing about an axis of rotation as the fiber optic cable is paid out from the spool, and wherein the fiber optic connector rotates in concert with the spool as the fiber optic cable is paid out from the spool; and

wherein access for plugging a connectorized end of the subscriber cable into the second connector port of the fiber optic adapter is: a) available from the front of the housing when the cover is in the open position; and b) not available from the front of the housing when the cover is in the closed position.

**22.** The fiber optic enclosure of claim **21**, wherein the cover is coupled to a minor side of the housing by a hinge.

**23.** The fiber optic enclosure of claim **21**, wherein the fiber optic connector is supported on the spool when the fiber optic cable is paid out from the spool.

**24.** The fiber optic enclosure of claim **21**, wherein the fiber optic adapter is coupled to the fiber optic connector, and wherein the fiber optic adapter rotates in concert with the spool as the fiber optic cable is paid out from the spool.

**25.** The fiber optic enclosure of claim **21**, wherein the fiber optic cable includes a plurality of optical fibers,

**12**

wherein a plurality of fiber optic connectors terminate the optical fibers at the first end of the fiber optic cable, wherein the fiber optic connectors rotate in concert with the spool as the fiber optic cable is paid out from the spool, wherein the telecommunications enclosure further includes a plurality of fiber optic adapters, wherein the plurality of fiber optic connectors are secured within the plurality of fiber optic adapters when the fiber optic cable is paid out from the spool.

**26.** The fiber optic enclosure of claim **21**, wherein a cable seal is provided at the cable opening.

**27.** The fiber optic enclosure of claim **21**, further comprising a cable manager within the housing for storing slack cable within the housing, the cable manager including a curved guide surface.

**28.** The fiber optic enclosure of claim **27**, wherein the cable manager is configured for storing the slack cable in a coil.

**29.** The fiber optic enclosure of claim **27**, wherein the cable manager includes a slack storage spool which defines the curved guide surface.

**30.** The fiber optic enclosure of claim **21**, further comprising means for storing slack cable in a coil within the housing.
