PILLOW WITH GUSSET OF OPEN CELL CONSTRUCTION

CROSS-REFERENCE TO RELATED APPLICATION

This application is a continuation application of U.S. patent application Ser. No. 15/602,870, filed May 23, 2017, which is a continuation application of U.S. patent application Ser. No. 15/362,285, filed Nov. 28, 2016, which issued as U.S. Pat. No. 9,895,011 and is a continuation application of U.S. patent application Ser. No. 14/698,411, filed Apr. 28, 2015, which is a continuation application of U.S. patent application Ser. No. 14/328,008 filed Jul. 10, 2014, which issued as U.S. Pat. No. 9,015,883 and is a continuation of U.S. patent application Ser. No. 14/107,665 filed Dec. 16, 2013, which issued as U.S. Pat. No. 8,887,332 and is a continuation of U.S. patent application Ser. No. 13/531,122, filed Jun. 22, 2012, which issued as U.S. Pat. No. 8,646,134 and claims priority to U.S. Provisional Patent Application No. 61/499,907 filed Jun. 22, 2011. The above-identified applications are incorporated herein by reference, in their entireties.

BACKGROUND OF THE INVENTION

1. Field of the Invention

The present invention relates to upper neck and head support in the form of a pillow for the human body.

2. Description of the Related Art

The use of a pillow made typically of a fabric cover stuffed with a compliant soft material is known in the prior art. Conventional pillows generally provide a soft cushion on which to place the head of an infant, child, or adult while resting or sleeping, either in bed, or on upholstered furniture in which case the pillows typically have a permanent fabric cover. Additionally, positional specific pillows have been heretofore devised and utilized for the purpose of supporting the head and neck of people.

SUMMARY OF THE INVENTION

A pillow is provided herein which includes a cover having opposing first and second panels. A gusset perimetrically bounds, and joins, the first and second panels. The gusset is formed of an open cell construction. Compliant fill material is disposed within the cover. Advantageously, with the subject invention, a pillow is provided allowing for lateral ventilation between opposing panels. This permits a cooling effect while a user is resting or sleeping.

An "open cell construction" as used herein refers to a construction having overall porosity greater than the inherent porosity of the constituent material or inherently having high porosity.

These and other features of the invention will be better understood through a study of the following detailed description and accompanying drawings.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a perspective view of a pillow formed in accordance with the subject invention;

FIG. 2 is a partial cut-away view of the pillow of FIG. 1;

2

FIGS. 3-5 depict different open cell constructions useable with the subject invention;

FIG. 6 is a perspective view of a pillow formed in accordance with the subject invention have a cover with separable portions; and,

FIG. 7 is a perspective view of a foam layer useable with the subject invention.

DETAILED DESCRIPTION OF THE INVENTION

With reference to the Figures, a pillow 10 is provided having generally a cover 12 with compliant fill material 14 disposed therein. The cover 12 includes opposing first and second panels 16, 18 and a gusset 20 which perimetrically bounds, and joins, the first and second panels 16, 18, the gusset 20 being formed of an open cell construction. The first and second panels 16, 18 are sized and shaped to accept a user's head to provide support therefor.

The gusset 20 preferably is generally flat. In addition, it is preferred that the gusset 20 have sufficient width to separate the first panel 16 from the second panel 18 so as to define an air flow channel therethrough. This, thus, allows for an open cell construction band to be defined about the pillow 10 between the first and second panels 16, 18. With pressure and/or heat applied to one or both of the first and second panels 16, 18, the gusset 20 provides venting therethrough of the interior of the cover 12. The venting may enhance the comfort of a user. With the first and second panels 16, 18 preferably defining each a generally rectangular footprint common with the gusset 20, the gusset 20 is provided as four contiguous portions, including two longer longitudinal portions 22 joined by two shorter end portions 24.

The open cell construction of the gusset 20 may be defined by various constructions. With reference to FIG. 3, the gusset 20 may be defined by a plurality of interlaced or spaced-apart strands 26 arranged randomly or in various patterns, such as a "x" pattern (FIG. 1) or a rectangular pattern (FIG. 3). The strands 26 may be of various materials, including, e.g., polyester, and may be elastic or inelastic. The strands 26 are arranged so that open cells 28 are defined therebetween. The strands 26 may be connected at points of intersection (e.g., by fusion, stitching, being tied, by a fastener, and so forth) or may be not connected so as to permit free movement between contacting strands 26. If connected, it is preferred that the strands 26 be formed of elastic material. In addition, the strands 26 may be disposed in multiple layers so as to define a three-dimensional structure in a direction towards the interior of the pillow 10.

With reference to FIG. 4, the gusset 20 may be formed of a base material 30, which is preferably a textile, such as a polyester textile. Apertures 32 may be defined in the base material 30 with the apertures 32 defining the open cells of the gusset 20. The apertures 32 are larger in size than any pores that may be inherently defined in the base material 30. The apertures 32 may be formed during manufacture of the base material 32 or formed after manufacture, such as by cutting, or material removal from, the base material 30. The apertures 32 may be unfinished or finished, such as with trim or stitching. The base material 30 may be single or multi-ply.

As a further variation, and with reference to FIG. 5, the gusset 20 may be formed with the base material 30 being inherently significantly porous. Preferably, the base material 30 is formed of 3D spacer fabric, which is inherently highly porous. More preferably, the base material 30 is formed of polyester 3D spacer fabric. The pores of the base material 30 may be formed with irregular or regular shapes, such as

circle-like or polygon-like shapes (e.g., diamond-like shapes). The porosity of the base material **30** may be substantially greater than the porosity of the material forming the first panel **16** and/or substantially greater than the porosity of the material forming the second panel **18**. “Substantially greater” refers to being at least greater than, but preferably being at least twice greater than. The base material **30** may be single or multi-ply. If multi-ply, the collective porosity of the base material **30**, through all layers, is considered as being substantially greater than the porosity of the material of either the first panel **16** or the second panel **18**.

The gusset **20** may include one or more of the open cell configurations described above in connection with FIGS. 3-5 singularly or in any combination.

The gusset **20** may be joined to the first and second panels **16, 18** using any conventional technique, including being sewn together. To provide the pillow **10** with a robust construction, it is preferred that piping **34**, or other reinforcing material and/or stitching, be provided at the points of connection between the gusset **20** and each of the first and second panels **16, 18**.

One or more labels **36** may be provided with the pillow **10** to indicate the intended use of the pillow **10**, and/or to provide additional or explanatory information regarding the pillow **10**. For example, with reference to FIG. 1, the label **36** may be in the form of banner **36A** which may be a strip of textile, e.g., satin, having indicia **38** thereon, e.g. by embroidery, with the banner **36A** being secured to a portion of the pillow **10**. Preferably, the banner **36A** with the indicia **38** thereon is located over a portion of the gusset **20**. The banner **36A** is preferably attached along one of its faces so as to have one face **37** exposed with the indicia **38** thereon. This allows for easy visual recognition of information related to the pillow **10**, such as an intended purpose of the pillow, even with a plurality of the pillows **10** being stacked. The label **36** may be also in the form of tag **36B** which may be in the form of one or more individual pieces of sheet material (e.g., paper and/or textile) which is affixed to the pillow **10** in any known technique, such as by sewing, gluing, mechanically fastening, and so forth. The tag **36B** may include printed, or otherwise provided thereon, information, such as care and/or allergy information. The tag **36B** may be secured at a seam in the cover **12**, such as along the connection between one of the first and second panels **16, 18** and the gusset **20**. The tag **36B** is preferably attached along one of its edges so as to have both faces viewable.

The indicia **38**, without the banner **36A**, may be directly affixed to the pillow **10**, such as by embroidery, printing or other marking. For example, the indicia **38** may be directly affixed to the gusset **20**, such as by embroidery. With direct application of the indicia **38** to the gusset **20**, the ability to pass air through the gusset **20** is minimally impacted.

Different fill materials **14** are possible for the pillow **10**. The fill material may be blends of hypoallergenic polyester fibers to achieve different levels of support versus softness as described above. For example, with the pillow **10** being intended for a stomach sleeping position, the pillow **10** may be provided with a fill of microfiber; with the pillow **10** being intended for a back sleeping position, the pillow **10** may be provided with a fill of a blend of conjugate and hollow slick fiber, and, with the pillow **10** being intended for a side sleeping position, the pillow **10** may be provided with a fill of cluster/ball fiber. As will be appreciated by those skilled in the art, other fills are possible. Various down, memory foam (solid layer(s) and/or clusters) and/or latex (solid layer(s) and/or springs), in varying combinations, may

be utilized with the pillow **10** herein. The indicia **38** may be provided to indicate the intended sleep position of the pillow **10** based on the fill material therein.

The pillow **10** may be of various configurations. In a preferred embodiment, the pillow **10** is provided with increased height at central portions, as shown in FIGS. 1 and 2. The fill material **14** is configured to provide the desired shape. More preferably, the first and second panels **16, 18** may be arcuately bowed-out in opposing directions (e.g., being convexly arc-shaped in opposing directions). Preferably, top edges **40** of the first and second panels **16, 18** are generally straight and parallel as viewed in a direction perpendicular to the first and second panels **16, 18**. The top edges **40** may be parallel to the longitudinal portions **22** of the gusset **20**. An area **42** may be defined between and be bounded by the top edge **40** and the longitudinal portion **22** on opposing sides of each of the first and second panels **16, 18**. The areas **42** are preferably flat and coplanar with the corresponding top edge **40** and longitudinal portion **22**.

The first and second panels **16, 18** each preferably include bottom edges **44**, each extending along the bottom of one of the areas **42**, and end edges **46**. The bottom edges **44** extend between the end edges **46** so as to define a generally rectangular profile. The gusset **20** is preferably attached to the first and second panels **16, 18** along the rectangular profiles of the bottom edges **44**/end edges **46** of the first and second panels **16, 18**.

The present invention provides the correct alignment to head and neck area for the specific position of the user (back, stomach or side) while at the same time creating an environment of cooling and airflow, which allows the sleeper to maintain their body temperature, and spine alignment, which encourages a normal sleep cycle.

To enhance the cooling effect, it is preferred that an inner cover **48** be provided, located inside the cover **12**, in which the fill material **14** is disposed. Preferably, the inner cover **48** is relatively resistant to air flow therethrough, such as being formed by one or more layers of non-woven material (e.g., 100% polyester). The inner cover **48** may be formed of spandex or a spandex blend, such as polyester/spandex; although less resistance to air flow therethrough is provided by spandex or a spandex blend as compared to non-woven material, the spandex or spandex blend provides greater elasticity than the non-woven material which may provide greater comfort to a user. The inner cover **48** acts as a barrier against air flow into the fill material **14**. With the gusset **20** being of open cell construction, air exchange about the inner cover **48** is permitted. This allows for heat dissipation and minimal heat collection within the pillow **10**. In addition, because the inner cover **48** acts as an air barrier during use, heat transfer by air flow into the fill material **14** may be reduced.

The first panel **14** and/or the second panel **18** may be formed of various materials particularly various textiles. Preferably, the first panel **14** and/or the second panel **18** is formed of a moisture-wicking fabric, such as 100% polyester fabric, rayon, nylon, or spandex-blend fabric for increased performance and stretch-ability, which allows for moisture dispersion and, thus, heat management to cool the head and body. A cooling material, such as a gel, may be applied interiorly to the front panel **14** and/or the second panel **18**. The cooling material may be silicon or polyether gel formed into layers and applied shapes, as well as, formed ceramics, neoprene and other material technology as developed and available for use to perform heat transfer and temperature regulation function. Depending on the nature and stability of the cooling material, the cooling material

5

may be applied internally and/or externally to the front panel **14** and/or the second panel **18**.

In an alternative embodiment, the first panel **14** and/or the second panel **18** may be partially or wholly formed with open cell construction. Any of the open cell constructions discussed above may be utilized. The first panel **14**, the second panel **18** and/or the gusset **20** may use the same or different open cell configurations in various combinations. The first panel **14**, the second panel **18** and/or the gusset **20** may be provided with different visual appearances (e.g., different colors, patterns, etc.) in various combinations.

To allow for washing of the cover **12**, the cover **12** may be formed by at least two partially or wholly separable portions **12A**, **12B**, as shown in FIG. **6**. By separating the separable portions **12A**, **12B**, the cover **12** may be removed from the fill material **14**, and the inner cover **48**, if used. Preferably, the cover **12** is separated along at least one of the longitudinal portions **22** of the gusset **20** and possibly along portions of one or both of the end portions **24** and/or along the other of the longitudinal portions **22**. One or more fasteners **50** may be provided to selectively join the separable portions **12A**, **12B**. The fastener(s) **50** is preferably a zipper, but may also include buttons, snaps, hook-and-pile fasteners, and so forth.

With the inner cover **48** being used, it is preferred that all of the fill material **14** be located therein. In an alternative embodiment, as shown in FIG. **6**, a portion of the fill material **14** may be located outside of the inner cover **48** within the cover **12**. If a portion of the fill material **14** is located outside of the inner cover **48**, it is preferred that the fill material **14** include one or more solid foam layers **52** located between the cover **12** and the inner cover **48**. In a preferred arrangement, the same number of similarly configured (shape, material) solid foam layers **52** are located on both sides of the inner cover **48**. As shown in FIG. **7**, the solid foam layers **52** may be shaped to impart overall shape to the pillow **10**. Preferably, the solid foam layers **52** have an arcuate profile to impart an outwardly-bowed shape to the first and second panels **16**, **18**.

What is claimed is:

1. A pillow comprising:

an outer cover having opposing first and second panels and a gusset joining the first panel with the second panel;

an inner cover disposed within the outer cover, the panels each having a porosity that is greater than a porosity of the inner cover, the inner cover being resistant to air flow therethrough; and

a fill material disposed within the inner cover, wherein the gusset is at least partially formed with an open cell construction, wherein the pillow is configured to have air go in and out of a portion of the gusset that is formed with the open cell construction.

2. A pillow as recited in claim **1**, wherein the first panel, the second panel and the gusset use the same open cell constructions.

3. A pillow as recited in claim **1**, wherein the first panel, the second panel and the gusset use different open cell constructions.

4. A pillow as recited in claim **1**, wherein the open cell construction is formed by interlaced strands.

5. A pillow as recited in claim **4**, wherein the interlaced strands are arranged randomly.

6. A pillow as recited in claim **4**, wherein the interlaced strands are arranged in a rectangular pattern.

6

7. A pillow as recited in claim **4**, wherein the interlaced strands are elastic.

8. A pillow as recited in claim **4**, wherein the interlaced strands are inelastic.

9. A pillow as recited in claim **4**, wherein the interlaced strands are connected at points of intersection.

10. A pillow as recited in claim **4**, wherein the interlaced strands are not fixed at points of intersection so as to permit free movement between contacting strands.

11. A pillow as recited in claim **4**, wherein the interlaced strands are disposed in multiple layers so as to define a three-dimensional structure in a direction towards an interior of the pillow.

12. A pillow as recited in claim **1**, wherein the gusset comprises a base material, apertures being defined in base material with the apertures defining the open cells of the gusset.

13. A pillow as recited in claim **12**, wherein the apertures are larger in size than any pores that may be inherently defined in the base material.

14. A pillow as recited in claim **1**, wherein the open cell construction is formed by spaced-apart strands.

15. A pillow as recited in claim **14**, wherein the spaced-apart strands are arranged so that open cells are defined therebetween.

16. A pillow as recited in claim **14**, wherein the spaced-apart strands are arranged randomly.

17. A pillow comprising:

an outer cover having opposing first and second panels and a gusset joining the first panel with the second panel;

an inner cover disposed within the outer cover, the panels each having a porosity that is greater than a porosity of the inner cover, the inner cover being resistant to air flow therethrough; and

a fill material disposed within the inner cover, wherein at least one of the first panel, the second panel and the gusset is wholly formed with an open cell construction, and

wherein the inner cover creates channels for air flow such that air goes into one of the panels along the inner cover and escapes out the gusset and to have air go into the gusset along the inner cover and escape out of one of the panels.

18. A pillow as recited in claim **17**, wherein the first panel, the second panel and the gusset use the same open cell configurations.

19. A pillow as recited in claim **17**, wherein the first panel, the second panel and the gusset use different open cell configurations.

20. A pillow comprising:

an outer cover having opposing first and second panels and a gusset joining the first panel with the second panel;

an inner cover disposed within the cover, the panels each having a porosity that is greater than a porosity of the inner cover, the inner cover being resistant to air flow therethrough; and

a fill material disposed within the inner cover, wherein the gusset is at least partially formed with open cell construction, and

wherein the pillow permits air exchange about the inner cover such that air can in and out of a portion of the gusset that is formed with the open cell construction.
